Figure 6(a) of the article by Kelleher *et al.* [(2014), *Acta Cryst.* D70, 2186–2196] is corrected.

In the article by Kelleher *et al.* (2014), Fig. 6(a) was incorrect and the locations of the CBM and Crisp1 were missing. The correct Fig. 6(a) is published here and the CBM and Crisp1 are now shown with a blue line and a red line, respectively.

**Figure 6**  
 The calveolin-binding motif. (a) The conserved calveolin-binding motif (CBM) is evident in the alignment of the sequences of SmVAL4, GPR1, Pryl1 and Pryl2. The secondary-structural elements shown are for SmVAL4 and GPR1 (PDB entry 4aiw). The location of the CBM is identified with a blue line, while the CRISP1 motif is shown as a red line.
