Received 19 August 2008; accepted 22 August 2008

Key indicators: single-crystal X-ray study; $T = 294$ K; mean $\sigma(\text{C}-\text{C}) = 0.007$ Å; disorder in main residue; R factor = 0.059; wR factor = 0.177; data-to-parameter ratio = 15.5.

The title compound, $[\text{Zn}(\text{C}_7\text{H}_4\text{BrO}_2)_2(\text{C}_{10}\text{H}_{14}\text{N}_2\text{O})_2(\text{H}_2\text{O})_2]$, is a monomeric complex with the Zn^{II} atom lying on an inversion center. It contains two 4-bromobenzoate, two diethylnicotinamide ligands and two water molecules, all of which are monodentate. The four O atoms in the equatorial plane around the Zn atom form a slightly distorted square-planar arrangement, while the distorted octahedral geometry is completed by two N atoms in the axial positions. The methyl group of one of the ethyl groups is disordered over two positions, with occupancies of *ca* 0.65 and 0.35. The two aromatic rings are oriented at an angle of $77.22(14)^\circ$. In the crystal structure, $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds link the molecules into chains along the *a* axis.

Diaquabis(4-bromobenzoato- κ O)bis(*N,N'*-diethylnicotinamide- κ N¹)zinc(II)**Aslı Öztürk, Tuncer Hökelek, Fureya Elif Özbek and Hacali Necefoğlu****S1. Comment**

Transition metal complexes with biochemical molecules show interesting physical and/or chemical properties, through which they may find applications in biological systems (Antolini *et al.*, 1982). The structure-function-coordination relationships of the arylcarboxylate ions in Zn^{II} complexes of benzoic acid derivatives may be changed, depending on the nature and position of the substituted groups on the benzene ring, the nature of the additional ligand molecule or solvent, and the medium of the synthesis (Nadzhafov *et al.*, 1981).

The solid-state structures of anhydrous zinc(II) carboxylates include one-dimensional (Clegg *et al.*, 1986a), two-dimensional (Clegg *et al.*, 1986b) and three-dimensional (Capilla & Aranda, 1979) polymeric motifs of different types, while discrete monomeric complexes with octahedral or tetrahedral coordination geometry are found if water or other donor molecules are coordinated to Zn (Usubaliev *et al.*, 1992).

N,N-Diethylnicotinamide (DENA) is an important respiratory stimulant. The structures of several complexes obtained by reacting divalent transition metal ions with DENA have been determined, including those of Cu₂(DENA)₂(C₆H₅COO)₄ (Hökelek *et al.*, 1995), [Zn₂(DENA)₂(C₇H₅O₃)₄].2H₂O (Hökelek & Necefoğlu, 1996), [Co(DENA)₂(C₇H₅O₃)₂(H₂O)₂] (Hökelek & Necefoğlu, 1997) and [Cu(DENA)₂(C₇H₄NO₄)₂(H₂O)₂] (Hökelek *et al.*, 1997).

The structure determination of the title compound, a zinc complex with two bromobenzoate (BB), two diethylnicotinamide (DENA) ligands and two water molecules, was undertaken in order to determine the properties of the BB and DENA ligands and also to compare the results obtained with those reported previously.

The title compound is a monomeric complex, with the Zn atom on a centre of symmetry. It contains two BB, two DENA ligands and two water molecules (Fig. 1). All ligands are monodentate. The four O atoms (O1, O4, and their symmetry-related atoms, O1', O4') in the equatorial plane around the Zn atom form a slightly distorted square-planar arrangement, while the slightly distorted octahedral coordination geometry is completed by the two N atoms of the DENA ligands (N1, N1') in the axial positions (Table 1 and Fig. 1).

The near equality of the C1—O1 [1.257 (5) Å] and C1—O2 [1.246 (5) Å] bonds in the carboxylate group indicates a delocalized bonding arrangement, rather than localized single and double bonds, as in other zinc(II) complexes: bis(4-hydroxybenzoato- κ O)bis(nicotinamide- κ N)zinc(II) (Necefoğlu *et al.*, 2002) and diaquabis(*N,N'*-diethylnicotinamide- κ N)bis(4-fluorobenzoato- κ O)-zinc(II) (Hökelek *et al.*, 2007). This may be due to the intramolecular O—H \cdots O hydrogen bonding of the carboxylate O atoms (Table 2). The Zn atom is displaced out of the least-squares plane of the carboxylate group (O1/C1/O2) by 0.885 (1) Å. The planar carboxylate group form dihedral angles of 3.09 (35)° and 80.21 (35)°, respectively, with the benzene (C2-C7) and pyridine (N1/C8-C12) rings. The dihedral angle between C2-C7 and N1/C8-C12 rings is 77.22 (14)°.

As can be seen from the packing diagram (Fig. 2), the molecules are linked into chains, along the *a* axis, by intermolecular O—H \cdots O hydrogen bonds (Table 2).

S2. Experimental

The title compound was prepared by the reaction of ZnNO_3 (1.27 g, 10 mmol) in H_2O (25 ml) and DENA (3.56 g, 20 mmol) in H_2O (25 ml) with sodium *p*-bromobenzoate (4.46 g, 20 mmol) in H_2O (100 ml). The mixture was filtered and set aside to crystallize at ambient temperature for several days, giving colourless single crystals.

S3. Refinement

The H atoms of C14 atom and the C15 methyl group were disordered. During the refinement process the disordered atoms were refined over two positions with occupancies of 0.65 (3) (for C15, H15A, H15B, H15C, H14A and H14B) and 0.35 (3) (for C15A, H15D, H15E, H15F, H14C and H14D). H atoms of water molecule were located in a difference map and refined isotropically with the O-H and H \cdots H distances restrained to 0.84 (1) and 1.37 (2) Å, respectively. The remaining H atoms were positioned geometrically [C-H = 0.93 (aromatic), 0.97 (methylene) and 0.96 Å (methyl)] and constrained to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C})$, where $x = 1.5$ for methyl H and $x = 1.2$ for all other H atoms.

Figure 1

The molecular structure of the title compound with the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. Hydrogen bonds are shown as dashed lines. Primed atoms are generated by the symmetry operator (1 -x, -y, 1 -z). Only the major disorder component is shown.

Figure 2

A partial packing diagram of the title compound, viewed down the *b* axis, showing hydrogen bonds (dashed lines) linking the molecules into chains. H atoms not involved in hydrogen bonding are omitted. The disordered atoms are omitted for clarity. Only the major disorder component is shown.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
