Redetermination of nickel(II) formate dihydrate

Matthias Weil*

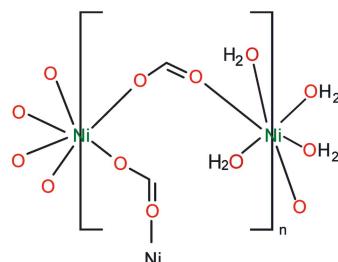

Institute for Chemical Technologies and Analytics, Division of Structural Chemistry, TU Wien, Getreidemarkt 9/164-SC, A-1060 Vienna, Austria. *Correspondence e-mail: matthias.weil@tuwien.ac.at

In comparison with the previous structure determination of poly[diaquadi- μ -formato-nickel(II)], $[\text{Ni}(\text{HCOO})_2(\text{H}_2\text{O})_2]_n$, based on Weissenberg film data [Krogmann & Mattes (1963). *Z. Kristallogr.* **118**, 291–302], the current redetermination from modern CCD data revealed the positions of the H atoms, thus making a detailed description of the hydrogen-bonding pattern possible. Both Ni^{2+} cations in the crystal structure are located on inversion centres and are octahedrally coordinated. One Ni^{2+} cation is bound to six O atoms of six formate anions whereas the other Ni^{2+} cation is bound to four O atoms of water molecules and to two formate O atoms. In this way, the formate anions bridge the two types of Ni^{2+} cations into a three-dimensional framework. O—H \cdots O hydrogen bonds of medium strength between water molecules and formate O atoms consolidate the packing.

Chemical scheme

Structure description

Recycling of tungsten carbide from WC–Ni hard metals or composites thereof can be achieved by debinding WC–Ni with formic acid to selectively dissolve nickel. Nickel formate then can either be crystallized as the dihydrate from the obtained solution, or formic acid can be regenerated through cation exchange with sulfuric acid. In the latter case, nickel can be precipitated as $\text{Ni}(\text{OH})_2$ from the intermediate nickel sulfate solution by adding caustic soda (Weissensteiner, 2012). In the course of these studies it became apparent that a redetermination of the crystal structure of nickel formate dihydrate, $\text{Ni}(\text{HCOO})_2 \cdot 2\text{H}_2\text{O}$, (Krogmann & Mattes, 1963) was desirable in terms of higher precision and accuracy and for an unambiguous assignment of the hydrogen-bonding scheme. Although a profile refinement using the Rietveld method has been performed on this material, leading to precise room-temperature lattice parameters (Kellerman *et al.*, 2016), improved structural data are still missing.

data reports

Table 1

Comparison of bond lengths (\AA) in the current and the previous refinement of $\text{Ni}(\text{HCOO})_2 \cdot 2\text{H}_2\text{O}$ ^(a,b).

	current refinement	previous refinement ^a
Ni1–O1 ⁱ	2.0302 (6)	2.026 (8)
Ni1–O2	2.0503 (6)	2.061 (8)
Ni1–O3	2.0942 (6)	2.097 (8)
Ni2–O5	2.0256 (7)	2.042 (8)
Ni2–O6	2.0663 (6)	2.059 (8)
Ni2–O4	2.1006 (7)	2.090 (8)
O1–C1	1.2593 (10)	1.256 (8)
O2–C1	1.2546 (10)	1.222 (8)
O3–C2 ⁱⁱ	1.2618 (10)	1.278 (8)
O4–C2	1.2607 (10)	1.247 (8)

Symmetry codes: (i) $-x + 1, y - \frac{1}{2}, -z + \frac{1}{2}$; (ii) $x, -y + \frac{3}{2}, z + \frac{1}{2}$. Notes: (a) Krogmann & Mattes (1963); lattice parameters $a = 8.60$ (1), $b = 7.06$ (1), $c = 9.21$ (2) \AA , $\beta = 96.50$ (10°) from single-crystal data at room temperature; (b) lattice parameters $a = 8.5951$ (1), $b = 7.0688$ (5), $c = 9.2152$ (2) \AA , $\beta = 97.41$ (1°) from Rietveld profile refinement at room temperature (Kellerman *et al.*, 2016).

The crystal structure of $\text{Ni}(\text{HCOO})_2 \cdot 2\text{H}_2\text{O}$ comprises two Ni^{2+} cations on inversion centres, one on Wyckoff position $2b$ (Ni1), one on $2a$ (Ni2), and two formate anions and two water molecules in general positions. The Ni^{2+} cations are stacked in rows parallel to [101]. Both cations have a distorted octahedral coordination environment by oxygen atoms, but with different types of ligands. Ni1 is bound to six O atoms of six formate

Table 2

Hydrogen-bond geometry (\AA , $^\circ$).

$D-\text{H}\cdots A$	$D-\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D-\text{H}\cdots A$
O6–H5 \cdots O3 ⁱ	0.787 (18)	1.985 (18)	2.7312 (9)	158.1 (16)
O5–H3 \cdots O2	0.89 (2)	1.87 (2)	2.7522 (9)	171.2 (19)
O5–H4 \cdots O4 ⁱ	0.832 (18)	1.898 (18)	2.7271 (10)	174.1 (17)
O6–H6 \cdots O1 ⁱⁱ	0.837 (18)	1.926 (18)	2.7610 (9)	175.5 (16)

Symmetry codes: (i) $-x, y + \frac{1}{2}, -z + \frac{1}{2}$; (ii) $-x, -y + 2, -z$.

anions (O1–O3 and symmetry-related counterparts), whereas Ni2 is bound to four O atoms of two pairs of water molecules (O5, O6 and symmetry-related counterparts) and two formate anions (O4 and its symmetry-related counterpart). Relevant bond lengths and a comparison with the previous determination are collated in Table 1. In general, bond lengths and angles are similar to related divalent first-row transition metal formates (Viertelhaus *et al.*, 2005).

Each of the two formate anions bridges two Ni^{2+} cations, thus creating a three-dimensional framework. O–H \cdots O hydrogen bonds of medium strength and with nearly linear O–H \cdots O angles between water molecules as donor groups and each of the formate carboxylate O atoms as acceptor groups help to consolidate this arrangement (Fig. 1, Table 2). In comparison with the previous determination, the H-atom positions are unambiguous and were clearly discernible from difference maps.

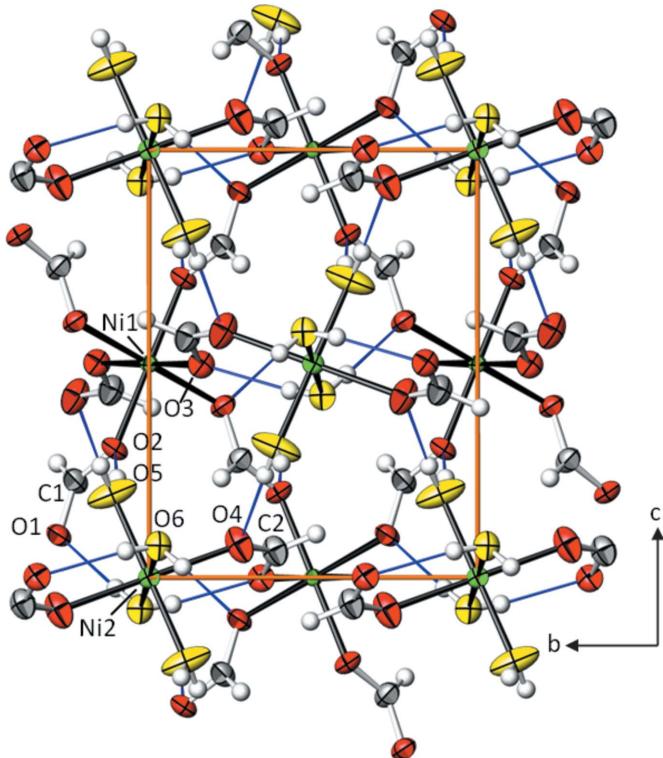

Figure 1

The crystal structure of $\text{Ni}(\text{HCOO})_2 \cdot 2\text{H}_2\text{O}$ in a projection along [−100]. Displacement ellipsoids are drawn at the 97% probability level. Ni atoms are green, C atoms grey, formate O atoms red, water O atoms yellow. H atoms are shown as white spheres of arbitrary radius; O–H \cdots O hydrogen bonding is indicated by thin blue lines.

Synthesis and crystallization

Crystals of the title compound were harvested from a saturated aqueous solution of nickel formate (Königswarter & Ebelt, Chemische Fabrik GmbH, Germany) that was stored in a closed glass bottle for several months.

Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. Starting coordinates for refinement were taken from the previous determination (Krogmann & Mattes, 1963).

Acknowledgements

Dr Christian Weissensteiner kindly supplied the crystals used for this redetermination.

Funding information

The X-ray centre of TU Wien is acknowledged for financial support and for providing access to the single-crystal X-ray diffractometer.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. H atoms bound to O atoms were located from a difference map and were refined freely.
