The title salt,  $C_{27}H_{37}N_2^+ \cdot ClO_4^-$ , arose as an unexpected oxidation product of the carbene 1,3-bis(2,6-diisopropylphenyl)-1,3-dihydro-2*H*-imidazol-2-ylidene in methanol. The five-membered cationic imidazolium ring is planar by symmetry and the complete cation is generated by a crystallographic twofold axis passing through the central N-bonded C atom and the mid-point of the C=C bond; the Cl atom of the perchlorate anion also lies on the rotation axis. The phenyl rings of the 2,6-diisopropylphenyl groups are each perpendicular to the imidazolium ring [dihedral angle = 90.0 (3) $^\circ$ ]. In the crystal, weak C—H···O and bifurcated C—H···(O,O) interactions between the imidazolium ring H atoms and the perchlorate O atoms lead to [001] chains.

## 3D view

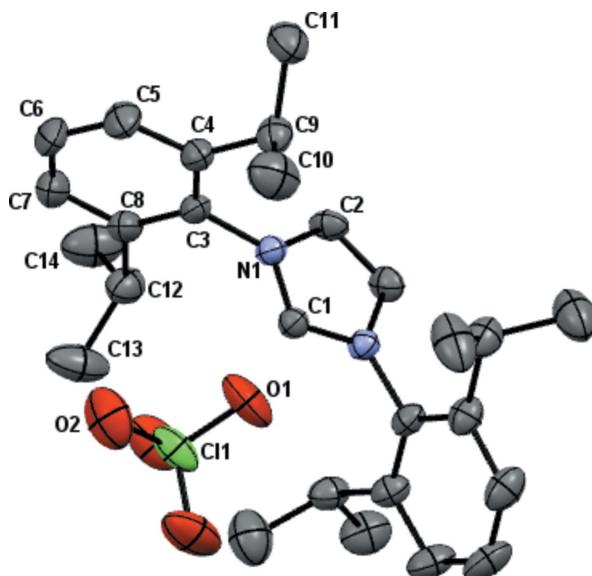

## Chemical scheme

## Structure description

Our ongoing research into the chemistry of diruthenium(II,III) tetracarboxylates led us to attempt axial coordination of N-heterocyclic carbenes to the diruthenium(II,III) core, as had successfully been accomplished on the analogous dirhodium(II,II) core (André *et al.*, 2008). Our attempts have been unsuccessful but we were able to isolate crystals of an oxidized imidizolium species as its title perchlorate salt in the course of one of our reactions.

The molecule consists of an imidazolium core with isopropylphenyl substituents attached to each heterocyclic nitrogen atom (Fig. 1). The bond lengths in the heterocycle: C2—C2( $\frac{3}{2} - x, \frac{1}{2} - y, z$ ) = 1.340 (4), N1—C1 = 1.326 (2) and N1—C2 = 1.378 (3) Å, are consistent with a double bond between the C2 carbon atoms and bond delocalization over the N—C—N part of the ring, similar to other isopropylphenyl derivatives (*e.g.* Arduengo *et al.*, 1999; Berger *et al.*, 2012; Blue *et al.*, 2006). In the crystal, extensive C—H···O hydrogen bonding is seen (Table 1) involving the C1—H1 grouping and the

**Figure 1**

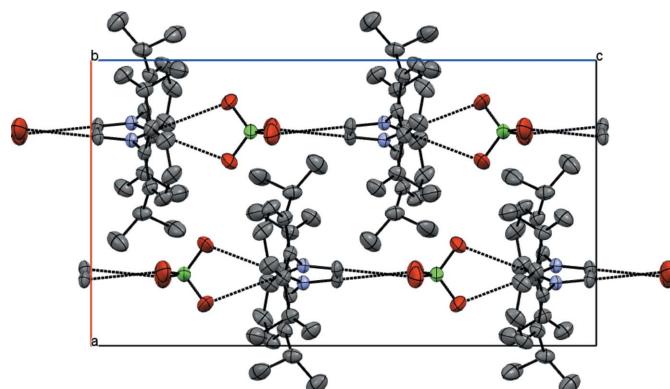

The molecular structure of the title compound with displacement ellipsoids at the 50% probability level. H atoms are omitted for clarity and unlabelled atoms are generated by the symmetry operator ( $-x + \frac{3}{2}$ ,  $-y + \frac{1}{2}$ ,  $z$ ).

perchlorate anion (symmetrically bifurcating two of the perchlorate oxygen atoms) as well as the C2–H2A grouping and the other perchlorate oxygen atom, leading to [001] chains (Fig. 2).

Crystal structures of perchlorate salts of imidazolium derivatives are rare (Crees *et al.*, 2010; Pesch *et al.*, 2004; Fürstner *et al.*, 2006) and there are none for the isopropylphenyl derivative.

### Synthesis and crystallization

Crystals of the title compound were isolated as a byproduct of the reaction of  $[\text{Ru}_2(\mu\text{-O}_2\text{CCH}_3)_4(\text{MeOH})_2](\text{ClO}_4)$  (0.100 g, 0.166 mmol) in 10 ml of methanol with a twofold excess of the carbene 1,3-bis(2,6-diisopropylphenyl)-1,3-dihydro-2*H*-imidazol-2-ylidene (0.131 g, 0.333 mmol) in 5 ml of methanol.

Computer programs: *APEX2* and *SAINT* (Bruker, 2010), *SHELXTL2018/1* (Sheldrick, 2015a), *SHELXL2018/1* (Sheldrick, 2015b) and *SHELXTL* (Sheldrick, 2008).

This solution was stirred for 2 h and after slow evaporation yielded a brown powder (ruthenium complex) and crystals of the de-protonated, oxidized, imidazolium, 1,3-bis(2,6-diisopropylphenyl)imidazolium, as a perchlorate salt.

### Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2.

### Funding information

Funding for this research was provided by: Natural Sciences and Engineering Research Council of Canada (grant to Manuel Aquino).

 $\Delta\rho_{\max} = 0.31$  e Å<sup>-3</sup>  
 $\Delta\rho_{\min} = -0.42$  e Å<sup>-3</sup>

#### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** All of the H atoms were placed in geometrically calculated positions, with C—H = 0.95 (aromatic), 1.00 (CH, aliphatic) and 0.98 Å (CH<sub>3</sub>), and refined as riding atoms, with  $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{C(methyl)})$ , or 1.2  $U_{\text{eq}}(\text{other C})$ . In addition, the methyl groups were refined with AFIX 137, which allowed the rotation of the methyl groups whilst keeping the C—H distances and X—C—H angles fixed.
