## N,N-Bis(2-bromoethyl)aniline

R. Vilma Bojan,* Richard A. Varga and Cristian Silvestru<br>Facultatea de Chimie si Inginerie Chimica, Univesitatea Babes-Bolyai, Cluj-Napoca, Ro-40028, Romania<br>Correspondence e-mail: brvilma@chem.ubbcluj.ro<br>Received 3 November 2007; accepted 6 November 2007<br>Key indicators: single-crystal X-ray study; $T=297 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.007 \AA$; $R$ factor $=0.037 ; w R$ factor $=0.088 ;$ data-to-parameter ratio $=19.5$.

The molecule of the title compound, $\mathrm{C}_{10} \mathrm{H}_{13} \mathrm{Br}_{2} \mathrm{~N}$, has a twofold rotation axis along the $\mathrm{N}-\mathrm{C}_{\text {phenyl }}$ bond. The compound shows a slightly distorted trigonal planar geometry around the N atom. The structural study shows the presence of intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{Br}$ interactions, resulting in a threedimensional supramolecular architecture.

## S1. Comment

$N, N$-Bis(2-halogenoalkyl)anilines are widely prepared compounds due to their potential pharmacological activity (Ross, 1949; Chapman \& Triggle, 1963; Panthananickal et al., 1978; Palmer et al., 1990). The most common preparation method uses the corresponding alcohol, which upon reaction with a halogenating agent gives the desired aniline derivative (Ross, 1949; Chapman \& Triggle, 1963). Some derivatives show anti-adrenaline and anti-noradrenalin activities and have also been investigated as anticancer drugs (Palmer et al., 1990). The great variety of obtainable derivatives upon changing the alkyl or the aryl group bonded to the nitrogen atom has made this type of compounds applicable as starting materials in the synthesis of macrocycles (Bricks et al., 2005; Hartley et al., 2000). The title compound was prepared according to a general method described in the literature starting from $N, N$-bis(2-hydroxyethyl)aniline, which was treated with $\mathrm{PBr}_{3}$ (Ross, 1949).
The isolated $N, N$-bis(2-bromoethyl)aniline crystallizes from benzene. The molecule has a twofold rotation axis through the $N-\mathrm{C}_{\text {phenyl }}$ bond (Fig. 1). The bond angles around the N 1 atom $\left[\mathrm{C} 1-\mathrm{N} 1-\mathrm{C} 5=120.7(3)^{\circ}\right.$ and $\mathrm{C} 5-\mathrm{N} 1-\mathrm{C} 5^{\mathrm{i}}$ $118.6(6)^{\circ}$; symmetry code: (i) $\left.0.5-x, 0.5-y, z\right]$ are consistent with a trigonal planar geometry and thus an $s p^{2}$ nature can be considered due to conjugation with the phenyl ring. The sructural analysis shows the presence of intermolecular C $\mathrm{H} \cdots \mathrm{Br}$ interactions in the crystal structure. One molecule of $N, N$-bis(2-bromoethyl)aniline forms interactions with four neighboring molecules [ $\mathrm{H} 5 \cdots \mathrm{Br} 1^{\mathrm{ii}}=3.05 \AA$; symmetry code: (ii) $\left.-x+3 / 4, y+1 / 4, z-1 / 4\right]$ (Fig. 2). These interactions result in a three-dimensional supramolecular architecture (Fig. 3).

## S2. Experimental

Colourless crystals of $\mathrm{N}, \mathrm{N}$-bis(2-bromoethyl)aniline, prepared according to the literature (Ross, 1949), were obtained from benzene. The compound was also characterized by ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ and two-dimensional NMR spectroscopy in $\mathrm{CDCl}_{3}$ solution. NMR data: ${ }^{1} \mathrm{H}$ NMR ( 300 MHz ): $\delta 3.47\left(\mathrm{t}, 4 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Br},{ }^{3} \mathrm{~J}_{\mathrm{HH}}=7.4 \mathrm{~Hz}\right.$ ), $3.79\left(\mathrm{t}, 4 \mathrm{H}, \mathrm{CH}_{2} \mathrm{~N},{ }^{3} \mathrm{~J}_{\mathrm{HH}}=7.4 \mathrm{~Hz}\right), 6.75$ $\left(\mathrm{d}, 2 \mathrm{H}, \mathrm{H}_{0},{ }^{3} \mathrm{~J}_{\mathrm{HH}}=8.3 \mathrm{~Hz}\right), 6.84\left(\mathrm{t}, 1 \mathrm{H}, \mathrm{H}_{\mathrm{p}},{ }^{3} \mathrm{~J}_{\mathrm{HH}}=7.3 \mathrm{~Hz}\right), 7.30\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}_{\mathrm{m}},{ }^{3} \mathrm{~J}_{\mathrm{HH}}=7.5 \mathrm{~Hz}\right) ;{ }^{13} \mathrm{C} \mathrm{NMR}(75.5 \mathrm{MHz}): \delta 27.95$ ( $\mathrm{s}, \mathrm{CH}_{2} \mathrm{Br}$ ), $53.47\left(\mathrm{~s}, \mathrm{CH}_{2} \mathrm{~N}\right), 112.35\left(\mathrm{~s}, \mathrm{C}_{\mathrm{o}}\right), 118.43\left(\mathrm{~s}, \mathrm{C}_{\mathrm{p}}\right), 129.80\left(\mathrm{~s}, \mathrm{C}_{\mathrm{m}}\right), 145.14\left(\mathrm{~s}, \mathrm{C}_{\mathrm{i}}\right)$.

## S3. Refinement

All hydrogen atoms were placed in calculated positions using a riding model, with $\mathrm{C}-\mathrm{H}=0.93$ or $0.97 \AA$ and with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$.

Figure 1
The molecular structure, showing the atom-numbering scheme. Displacement ellipsoids are drawn at the $50 \%$ probability level. H atoms have arbitrary radii. Symmetry code: (i) $0.5-x, 0.5-y, z$.

Figure 2
Hydrogen-bonded framework (dashed lines) in the title compound. Symmetry codes: (i) $0.5-x, 0.5-y, z$; (ii) $-x+3 / 4, y+$ $1 / 4, z-1 / 4$.

Absolute structure parameter: 0.05 (3)

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
