Key indicators: single-crystal X-ray study; T = 298 K; mean σ(C–C) = 0.002 Å; R factor = 0.042; wR factor = 0.098; data-to-parameter ratio = 16.7.

The asymmetric unit of the title compound [systematic name: benzamidinium 3,3′,5,5′-tetrahydroxy-1,1′-spirobi[2,4,6-trioxa-1,3,5-triboracyclohexane](1−) sesquihydrate], $C_7H_9N_2^+\cdot B_5H_4O_{10}^-\cdot 1.5H_2O$, is composed of two protonated benzamidinium cations, two tetrahydropentaborate anions and three water molecules of crystallization. The ions and water molecules are associated in the crystal structure by an extensive three-dimensional hydrogen-bonding network, which consists mainly of cation-to-anion N—H···O and anion-to-anion O—H···O hydrogen bonds.

Benzamidinium tetrahydropentaborate sesquihydrate

Gustavo Portalone

S1. Comment

The asymmetric unit of the title compound (Fig. 1) comprises two planar benzamidinium cations, two tetrahydropentaborate anions and three water molecules of crystallization. The anions consist of a central BO_4 tetrahedron fused to four trigonal planar $BO_3(OH)$ units. Both cations and the anions show normal geometric parameters (Table 1). Analysis of the crystal packing (Fig. 2) shows that adjacent $[B_5O_6(OH)_4]^-$ units are hydrogen bonded to form eight-membered rings of graph set $R^2_2(8)$ (Etter *et al.*, 1990; Bernstein *et al.*, 1995; Motherwell *et al.*, 1999). This anion-to-anion hydrogen-bonding framework is supplemented by the formation of five hydrogen bonds from each benzamidinium cation to adjacent $[B_5O_6(OH)_4]^-$ anions (Table 2). Interestingly, two of the three water molecules of crystallization form hydrogen bonds which involve all the available hydrogen-bond donor/acceptor sites, at variance with what has been found in a survey of 3315 organic hydrate crystal structures. In this study (Gillon *et al.*, 2003) it has been shown that the most common environment is one in which water forms three hydrogen bonds, two as donor and one as acceptor.

S2. Experimental

$B(OH)_3$ (90 mg, 0.15 mmol, Sigma Aldrich at 99.5% purity) was added to a stirred solution of benzamidine, $C_7H_8N_2$, (12 mg, 0.1 mmol, Fluka at 95% purity) in water (10 ml) and heated under reflux for 3 h. After cooling the solution to ambient temperature, crystals suitable for single-crystal X-ray diffraction were grown by slow evaporation of the solvent over several days.

S3. Refinement

All H atoms were found in a difference map. Positional and isotropic parameters of H atoms of the hydroxy and amino groups, as well as positional parameters of H atoms of the water molecules having U_{iso} values equal to $1.5U_{eq}(O)$, were refined. H atoms of the phenyl rings were positioned with idealized geometry and refined isotropically using a riding model (C–H = 0.97 Å), and their U_{iso} values were kept equal to $1.2U_{eq}(C)$. An antibump restrain was introduced in the final calculation to prevent solvent molecules from approaching too close to one another.

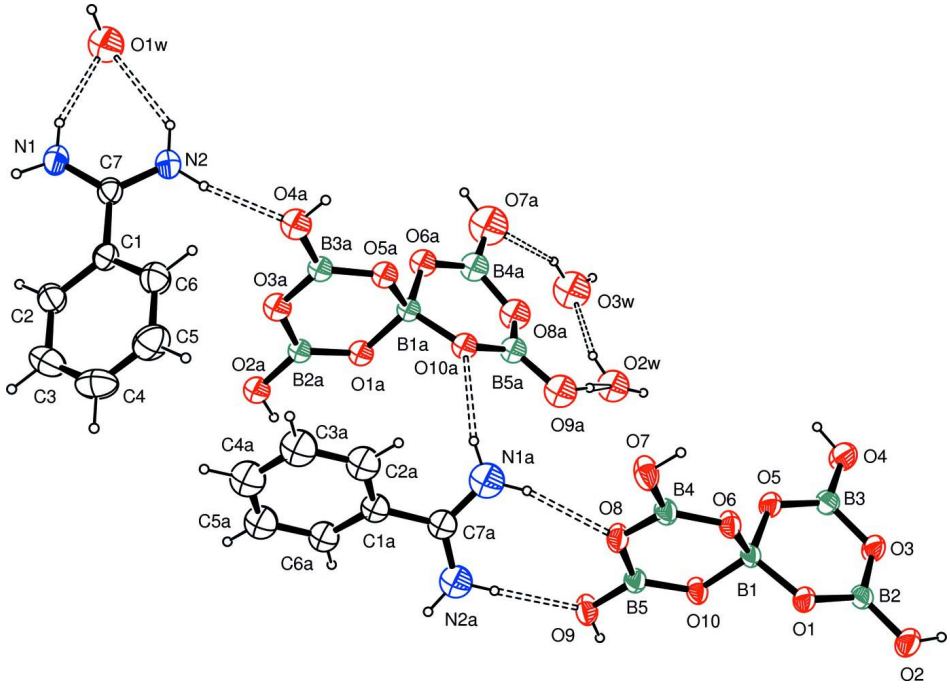

Figure 1

The molecular structure of the title compound, showing the atom-labelling scheme. Displacements ellipsoids are at the 50% probability level. Hydrogen bonding is indicated by dashed lines.

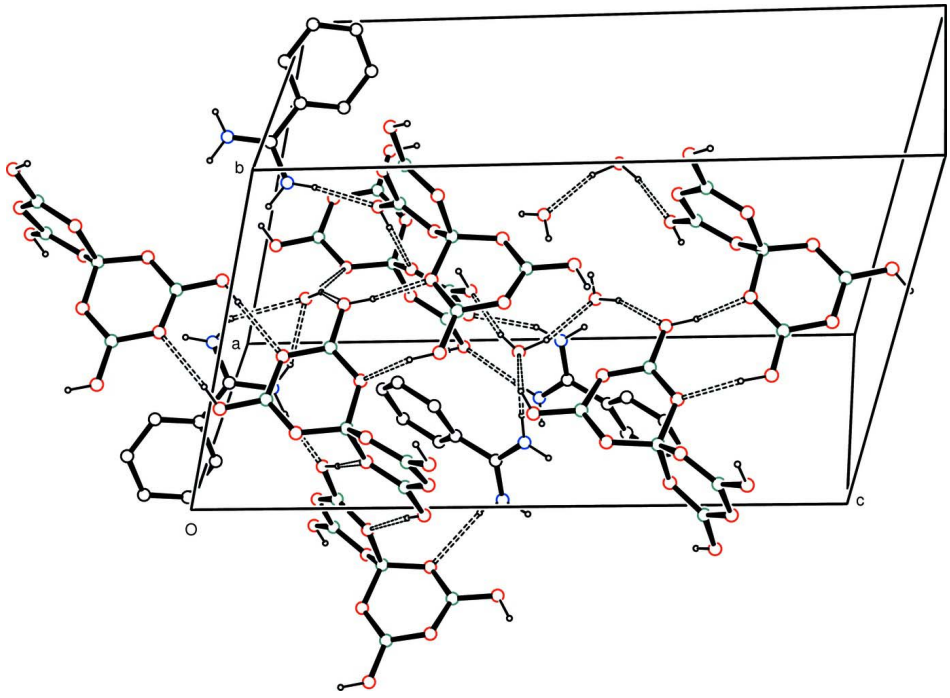

Figure 2

Crystal packing diagram for the title compound viewed approximately down the a axis. All atoms are shown as small spheres of arbitrary radii. For the sake of clarity, H atoms not involved in hydrogen bonding are omitted. Hydrogen bonding is indicated by dashed lines.

$\Delta\rho_{min} = -0.22$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
