## Chlorido(dimethyl sulfoxide- $\kappa S$ ) [2-(2-pyridyl)phenyl- $\left.\kappa^{2} N, C^{1}\right]$ platinum(II)

Masayuki Kobayashi, Shigeyuki Masaoka and Ken Sakai*

Department of Chemistry, Faculty of Science, Kyushu University, Hakozaki 6-10-1, Higashi-ku, Fukuoka 812-8581, Japan

Correspondence e-mail: ksakai@chem.kyushu-univ.jp

Received 16 September 2008; accepted 18 September 2008

Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.007 \mathrm{~A}$; $R$ factor $=0.024 ; \omega R$ factor $=0.064$; data-to-parameter ratio $=17.3$.

In the title compound, $\left[\operatorname{Pt}\left(\mathrm{C}_{11} \mathrm{H}_{8} \mathrm{~N}\right) \mathrm{Cl}\left(\mathrm{C}_{2} \mathrm{H}_{6} \mathrm{OS}\right)\right]$, the S atom of dimethyl sulfoxide is trans to the pyridyl N atom $[\mathrm{Pt}-\mathrm{S}=$ 2.2181 (11) $\AA$ ] and the chlorido ligand is trans to the carbon donor of 2-(2-pyridyl)phenyl $[\mathrm{Pt}-\mathrm{Cl}=2.4202$ (10) $\AA$ A]. The [2-(2-pyridyl)phenyl]platinum(II) unit forms a one-dimensional stack along the $c$ axis with two independent interplanar separations of 3.44 (9) and 3.50 (2) $\AA$.

Masayuki Kobayashi, Shigeyuki Masaoka and Ken Sakai

## S1. Comment

Interests over many years have concentrated on the molecular catalysis of $\mathrm{Pt}^{\mathrm{II}}$ complexes in photochemical hydrogen production from water (Sakai et al., 1993; Ozawa et al., 2006; Sakai \& Ozawa, 2007; Ozawa, Yokoyama et al., 2007). The results obtained so far suggest that destabilization of the HOMO, which generally corresponds to the filled $\mathrm{Pt}^{\text {II }} \mathrm{d}_{z} 2$ orbital, gives rise to the higher $\mathrm{H}_{2}$-evolving activity of the complexes (Sakai \& Ozawa, \& Sakai, 2007). It has also been ascertained that the mononuclear $\mathrm{Pt}^{\mathrm{HI}}$ complexes possessing a cis- $\mathrm{PtCl}_{2}$ unit, such as cis- $\mathrm{PtCl}_{2}\left(\mathrm{NH}_{3}\right)_{2}, \mathrm{PtCl}_{2}\left(4,4^{\prime}\right.$-dicarb-oxy-2, $2^{\prime}$-bipyridine), and $\mathrm{PtCl}_{2}\left(2,2^{\prime}\right.$-bipyrimidine), exhibit considerably higher $\mathrm{H}_{2}$-evolving activity in comparison with those only having the amine or pyridyl type of neutral ligands, such as $\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}$ and $\left[\mathrm{Pt}(\mathrm{bpy})_{2}\right]^{2+}$ (Ozawa, Yokoyama et al., 2007). In this context, the 2 -phenylpyridinate (ppy) ligand was selected because of the well known strong $\sigma$-donating character of the $\mathrm{C}(\mathrm{ppy})$ donor, expecting the higher energy level of the HOMO for the $\mathrm{Pt}^{\mathrm{H}}(\mathrm{ppy})$ complexes. As a result, the first water-soluble salt of $\left[\mathrm{Pt}(\mathrm{ppy}) \mathrm{Cl}_{2}\right]$, that is, $[\mathrm{K}(18$-crown- $)]\left[\mathrm{Pt}(\mathrm{ppy}) \mathrm{Cl}_{2}\right] \cdot 0.5 \mathrm{H}_{2} \mathrm{O}$ ( 18 -crown- $6=1,4,7,10,13,16$ hexaoxacyclooctadecane) [abbreviated as compound (II)], was recently prepared in our group and its catalytic activity in photochemical hydrogen production from water was examined in detail (Kobayashi et al., in submission). The title compound, $\operatorname{Pt}(\mathrm{ppy}) \mathrm{Cl}(\mathrm{DMOS}-\mathrm{S})$ (DMSO = dimethyl sulfoxide) [abbreviated as compound (I)], was first prepared from recrystallization of (II) from DMSO, but an improved synthetic route is reported in this work (see Experimental Section). It has been ascertained that the $\mathrm{H}_{2}$-evolving activity of (I) is much lower than that of (II), the reason for which remains ambiguous at the moment.
The donor atoms, except for the sulfur atom S1, comprise a planar geometry and the Pt atom (Pt1) does not deviate from this plane at all. The four-atom r.m.s. deviation, given in the best-plane calculation for the plane defined by atoms $\mathrm{N} 1, \mathrm{C} 11, \mathrm{Cl1}$, and Pt1, was negligible ( 0.0003 ). Hereafter, this plane is defined as the Pt coordination plane. The sulfur atom ( S 1 ) and the oxygen atom ( O 1 ) of DMSO are only slightly shifted out of this plane by 0.067 (5) and 0.045 (8) $\AA$, respectively. The torsion angles given by $\mathrm{C} 11 — \mathrm{Pt} 1-\mathrm{S} 1-\mathrm{O} 1=2.4$ (2) and $\mathrm{Cl} 1 — \mathrm{Pt} 1-\mathrm{S} 1-\mathrm{O} 1=-177.83(17)^{\circ}$ also reveal that the oxygen atom of DMSO is not largely shifted out of the coordination plane. Thus, it can be considered that (I) adopts a pseudo mirror symmetry. The benzene ring consisting of atoms $\mathrm{C} 6-\mathrm{C} 11$ is nearly coplanar with the coordination plane, where the dihedral angle between the benzene and the coordination planes is calculated as $0.7(2)^{\circ}$. The pyridyl plane defined by atoms N 1 and $\mathrm{C} 1-\mathrm{C} 5$ is slightly declined with respect to the coordination plane by 2.8 (2) $)^{\circ}$. The dihedral angle between the two aromatic rings is $2.5(2)^{\circ}$.

The ppy ligand in compound (I, Fig. 1) does not suffer from any disorder problem. Indeed, there is a clear difference in the bond lengths of $\mathrm{Pt}-\mathrm{N}(\mathrm{ppy})$ and $\mathrm{Pt}-\mathrm{C}(\mathrm{ppy}) ; \mathrm{Pt}-\mathrm{N} 1=2.069$ (3) and $\mathrm{Pt} 1-\mathrm{C} 11=2.002$ (4) $\AA$. Because of the strong trans influence originated by the $\mathrm{C}(\mathrm{ppy})$ donor, Pt 1 - Cl 1 distance $[2.4202(10) \AA$ ] is longer than those reported for $\operatorname{PtCl}_{2}\left(2,2^{\prime}\right.$-bipyridine) [2.281 (4)-2.306 (2) $\AA$; Herber et al., 1994]. Th Pt1-Cl1 distance is comparable to the value reported for $\mathrm{Pt}(\mathrm{ppy})(\mathrm{Hppy}) \mathrm{Cl}$ [2.4145 (23) $\AA$; Mdleleni et al., 1995]. In addition, the Pt 1 — S 1 bond distance [2.2181 (11) $\AA]$, in the position trans to the $\mathrm{N}(\mathrm{ppy})$ donor, is comparable to those previously reported for $\operatorname{Pt}(2-(4-\mathrm{fluorophenyl})-$
pyridine) $\mathrm{Cl}(\mathrm{DMSO})$ [2.2161 (16) $\AA$; Newman et al., 2007].
On the other hand, compound (I) forms a one-dimensional stack along the $c$ axis based on the $\pi-\pi$ stacking interactions between the phenylpyridinatoplatinum(II) units (see Fig. 2). The separation between the two adjacent planes is estimated as 3.44 (9) $\AA$ for the stack shown in Fig. 4 and 3.50 (2) $\AA$ for that in Fig. 5. In the former (Fig. 4), atoms C1 $1^{\mathrm{i}}, \mathrm{C}^{\mathrm{i}}, \mathrm{N} 1^{\mathrm{i}}$, and $\mathrm{Pt} 1^{\mathrm{i}}$ have an interaction to the phenylpyridinate moiety originally located and therefore shifts of these atoms from the best plane defined by atoms N 1 and $\mathrm{C} 1-\mathrm{C} 11$ are used to calculate the separation of the two stacked planes at this geometry. In the latter (Fig. 5), atoms $\mathrm{N} 1{ }^{\mathrm{ii}}, \mathrm{C} 1{ }^{\mathrm{ii}}, \mathrm{C} 2, \mathrm{C} 5^{\mathrm{ii}}, \mathrm{C} 6^{\mathrm{ii}}, \mathrm{C} 10^{\mathrm{ii}}, \mathrm{C} 11^{\mathrm{ii}}$, and $\mathrm{Pt} 1^{1 i}$ are involved in the $\pi$-stacking association and their shifts from the best plane defined by atoms N 1 and $\mathrm{C} 1-\mathrm{C} 11$ are similarly used to calculate the separation at this geometry. In these geometries, strong $\mathrm{d}-\pi$ interactions also contribute to the stabilization of stacking associations $\left[\mathrm{Pt} 1 — \mathrm{C} 4^{\mathrm{i}}=3.525\right.$ (4) and $\mathrm{Pt} 1 — \mathrm{C} 4{ }^{\mathrm{ii}}=3.523$ (4) $\AA$; symmetry codes: (i) $-x, y, 0.5-z$; (ii) $\left.-x, 1-y, 1-z\right]$. Finally, it must be noted that metal-metal interactions are unimportant in this crystal [ $\mathrm{Pt} 1 — \mathrm{Pt} 1^{\mathrm{i}}=5.9946$ (8) and $\mathrm{Pt} 1 —$ Pt1 $1^{\text {ii }}=5.4225(9) \AA ̊$, where the symmetry operations are same to those given in Fig. 4 and Fig. 5.

## S2. Experimental

A mixture of $c i s-\mathrm{PtCl}_{2}(\mathrm{DMSO})_{2}(0.21 \mathrm{~g}, 0.50 \mathrm{mmol})$ and 2-phenylpyridine $(0.078 \mathrm{~g}, 0.50 \mathrm{mmol})$ in methanol ( 10 ml ) was sealed in a pressure-resistant vial and was stirred at 393 K for 3 h . After the solution was cooled down to room temperature, the yellow precipitate of compound (I) was filtrated and dried in vacuo (Caution! Do not open the vial while it is hot, since the solution splashes out because of the violent boiling phenomenon upon a sudden decrease in pressure). Yield: $0.14 \mathrm{~g}(60 \%)$. Analysis calculated for $\mathrm{C}_{13} \mathrm{H}_{14} \mathrm{ClNOPtS}$ : C 33.73, H 3.05, N 3.03. Found: C 33.95, H 2.99, N 3.02. ${ }^{1} \mathrm{H}$ NMR ( 300.53 MHz , acetone-d ${ }_{6}$ ), p.p.m.: $\delta 9.63\left[\mathrm{~d}, \mathrm{~J}=5.97 \mathrm{~Hz},{ }^{3}\left({ }^{195} \mathrm{Pt-}{ }^{1} \mathrm{H}\right)=17.8 \mathrm{~Hz}, 1 \mathrm{H}\right], 8.37[\mathrm{~d}, \mathrm{~J}=6.81 \mathrm{~Hz}$, $\left.{ }^{3} \mathrm{~J}\left({ }^{195} \mathrm{Pt}-{ }^{-1} \mathrm{H}\right)=22.8 \mathrm{~Hz}, 1 \mathrm{H}\right], 8.16-8.06(\mathrm{~m}, 2 \mathrm{H}), 7.25(\mathrm{~d}, \mathrm{~J}=6.46 \mathrm{~Hz}), 7.48(\mathrm{t}, \mathrm{J}=6.43 \mathrm{~Hz}), 7.20-7.11(\mathrm{~m}, 2 \mathrm{H}), 3.63[\mathrm{~s}$, $\left.{ }^{3} \mathrm{~J}\left({ }^{195} \mathrm{Pt}-{ }^{1} \mathrm{H}\right)=12.2 \mathrm{~Hz}, 6 \mathrm{H}\right]$. A good quality single-crystal was prepared by diffusion of methanol into a DMSO solution of (I).

## S3. Refinement

All H atoms were placed in idealized positions (methyl $\mathrm{C}-\mathrm{H}=0.98 \AA$ and aromatic $\mathrm{C}-\mathrm{H}=0.95 \AA$ ), and included in the refinement in a riding-model approximation, with $U_{\text {iso }}(\mathrm{H})=1.5 \mathrm{U}_{\mathrm{eq}}\left(\right.$ methyl C) and $U_{\text {iso }}(\mathrm{H})=1.2 \mathrm{U}_{\text {eq }}$ (aromatic C). In the final difference Fourier map, the highest peak was located $0.83 \AA$ from atom Pt1. The deepest hole was located $1.07 \AA$ from atom H9.

$\Delta \rho_{\text {min }}=-1.43 \mathrm{e}^{-3}$

## Special details

Experimental. The first 50 frames were rescanned at the end of data collection to evaluate any possible decay phenomenon. Since it was judged to be negligible, no decay correction was applied to the data.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry.
An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Rms deviation of fitted atoms $=0.0228$
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
