In the title compound, $C_{13}H_{10}N_2O_2$, a Schiff base derivative, the dihedral angle between the two aromatic rings is 31.58 (3)°. The C=N double bond is essentially coplanar with the nitrophenyl ring. The torsion angle of the imine double bond is 175.97 (13)°, indicating that the C=N double bond is in a *trans* configuration. The crystal structure is stabilized by C—H···O contacts and π–π interactions (centroid–centroid distances of 3.807 and 3.808Å).

Related literature

Choi *et al.* (2000) and Nakamura *et al.* (1999) discuss the use of Schiff bases in the reduction of thionyl chloride, while Maruyama *et al.* (1995) and Burrows *et al.* (1996) describe their use in degradation processes. S1. Comment

Schiff bases and their complexes are widely studied because of their interesting and important properties such as their ability to reversibly bind oxygen (Park *et al.*, 1998) and their use in catalysis. They are part of redox systems in biological systems (Landy, 1989), they are used in the degradation of dyes through decomposition of hydrogen peroxide and other reagents in the textile industry (Maruyama *et al.*, 1995) as well as in the reduction of thionyl chloride (Choi *et al.*, 2000; Nakamura *et al.*, 1999). These compounds can also be used in the degradation of organic compounds (Burrows *et al.*, 1996) and in radiopharmaceuticals (Yoon *et al.*, 1990). Schiff bases also exhibit antineoplastic (Hodnett *et al.*, 1970) antibacterial (Rajavel *et al.*, 2008) and antifungal (Yu *et al.* 2007) activities. The compound whose crystal structure is reported was synthesized for comparative studies of the biological applications of Schiff bases with and without a ferrocene moiety. The synthesis of the present compound was reported earlier by Torregrosa (Torregrosa *et al.*, 2005), Hartley (Hartley *et al.*, 2002) and Naeimi (Naeimi *et al.*, 2008). We have utilized a different modified method for the synthesis of this compound as described below.

Geometric parameters of the title compound (Fig. 1) are in the usual ranges. The molecule is composed of two almost planar moieties, the 3-nitrobenzylidene moieties and the phenyl ring. The dihedral angle between the two aromatic rings is 31.58 (3)°. The torsion angle C11-N1-C1-C2 [175.97 (13)°] shows that the C-N double bond is trans configured. The crystal packing (Fig. 2) is stabilized by some short C-H···O contacts (see Table 1) and π–π stacking interactions ($\text{cog}_{\text{phenyl}}$···$\text{cog}_{\text{nitrophenyl}}^{\text{i}}$ = 3.807Å, $\text{cog}_{\text{phenyl}}$···$\text{cog}_{\text{nitrophenyl}}^{\text{ii}}$ = 3.808Å; symmetry operators: (i) -1/2+x, 3/2-y, 1-z; (ii) 1/2+x, 3/2-y, 1-z).

S2. Experimental

In a 250 ml pre-backed two neck flask supplied with a magnetic stirrer, 4 ml (43 mmol) of freshly distilled aniline was mixed with 4.97 g (43 mmol) of 3-nitrobenzaldehyde in dry toluene as the solvent. The reaction mnixture was heated to reflux using a Dean and Stark apparatus for azeotropic removal of water formed during the reaction. Reaction progress was monitored using TLC and the solid obtained after rotary evaporation was recrystallized from a mixture of ethyl acetate and n-hexane. Yield: 80%, melting point: 337-338K.

S3. Refinement

All H atoms could be located by difference Fourier synthesis. Nevertheless, they were refined with fixed individual isotropic displacement parameters [$U_{\text{iso}}(H)$ = 1.2 $U_{\text{eq}}(C)$] using a riding model with C—H = 0.95 Å.

In the absence of anomalous scatterers, the Flack (1983) parameter is meaningless and therefore Friedel pairs were merged prior to refinement.
Figure 1

Crystal data

$C_{13}H_{10}N_2O_2$	$F(000) = 472$
$M_r = 226.23$	$D_x = 1.361$ Mg m^{-3}
Orthorhombic, $P2_12_12_1$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: P 2ac 2ab	Cell parameters from 7899 reflections
$a = 7.3177$ (6) Å	$\theta = 3.7$–25.8°
$b = 12.1022$ (11) Å	$\mu = 0.09$ mm^{-1}
$c = 12.4672$ (12) Å	$T = 173$ K
$V = 1104.10$ (17) Å^3	Block, colourless
$Z = 4$	$0.48 \times 0.48 \times 0.46$ mm

Data collection

Stoe IPDSII two-circle diffractometer	1421 reflections with $I > 2\sigma(I)$
	$R_{int} = 0.054$
Radiation source: fine-focus sealed tube	$\theta_{max} = 29.5°$, $\theta_{min} = 3.6°$
Graphite monochromator	$h = -9 \rightarrow 8$
ω scans	$k = -16 \rightarrow 14$
9868 measured reflections	$l = -15 \rightarrow 17$
1585 independent reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	
$R[F^2 > 2\sigma(F^2)] = 0.034$	Secondary atom site location: difference Fourier map
$wR(F^2) = 0.093$	
$S = 1.04$	Hydrogen site location: inferred from neighbouring sites
1585 reflections	
154 parameters	H-atom parameters constrained
0 restraints	

$w = 1/[\sigma^2(F_o^2) + (0.0638P)^2 + 0.081P]$
  where $P = (F_o^2 + 2F_c^2)/3$
$(\Delta/\sigma)_{max} < 0.001$

$\Delta\rho_{max} = 0.26$ e Å⁻³
$\Delta\rho_{min} = -0.14$ e Å⁻³

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
