Department of Applied Chemistry, College of Sciences, Nanjing University of Technology, Nanjing 210009, People's Republic of China Correspondence e-mail: yaobq123@126.com

Received 2 January 2009; accepted 10 January 2009

Key indicators: single-crystal X-ray study; T = 296 K; mean  $\sigma$ (C–C) = 0.003 Å; R factor = 0.033; wR factor = 0.089; data-to-parameter ratio = 18.4.

The asymmetric unit of the title compound,  $(C_{13}H_{11}Cl_2N_2)_2$ -[Ni(C<sub>4</sub>N<sub>2</sub>S<sub>2</sub>)<sub>2</sub>], contains one-half of a centrosymmetric [Ni(mnt)<sub>2</sub>] anion (where mnt is maleonitriledithiolate or 1,2dicyano-1,2-ethylenedithiolate) and an (*E*)-1-(3,4-dichlorobenzylideneamino)-4-methylpyridinium cation. In the anion, the coordination around the Ni atom is a distorted square. In the cation, the aromatic rings are oriented at a dihedral angle of 7.81 (3)°. In the crystal structure, intermolecular C-H···N hydrogen bonds link the cations and anions.  $\pi$ - $\pi$  Contacts between the nickel dithiolene and pyridine rings and between the benzene and pyridine rings, [centroid-centroid distances = 3.682 (3) and 3.643 (3) Å, respectively] may further stabilize the structure.

## S1. Comment

Square-planar M[dithiolene]<sub>2</sub> complexes have attracted extensive interests in the areas of conducting and magnetic materials, dyes, non-linear optics and catalysis (Robertson *et al.*, 2002; Cassoux *et al.*, 1991). We report herein the crystal structure of the title compound.

The asymmetric unit of the title compound (Fig. 1) contains one-half of centrosymmetric  $[Ni(mnt)_2]$  (where mnt is maleonitriledithiolate) anion and a (*E*)-1-(3,4-di-chlorobenzylideneamino)-4-methylpyridinium cation. In the anion, the coordination around the Ni atom is a distorted square (Table 1). The bond lengths (Allen *et al.*, 1987) and angles are within normal ranges. Rings A (Ni1/S1/S2/C2/C3), B (N3/C5-C9) and C (C12-C17) are, of course, planar and they are oriented at dihedral angles of A/B = 16.69 (3)°, A/C = 13.47 (3)° and B/C = 7.81 (3)°.

In the crystal structure, intermolecular C-H···N hydrogen bonds (Table 2) link the cations and anions (Fig. 2), in which they may be effective in the stabilization of the structure. The  $\pi$ - $\pi$  contacts between the nickel dithiolene and the pyridine rings and the benzene and the pyridine rings, Cg1—Cg3<sup>i</sup> and Cg3—Cg4<sup>ii</sup> [symmetry codes: (i) 1/2 + x, 1/2 - y, 1/2 + z; (ii) 1 - x, 1 - y, -z, where Cg1, Cg3 and Cg4 are centroids of the rings A (Ni1/S1/S2/C2/C3), B (N3/C5-C9) and C (C12-C17), respectively] may further stabilize the structure, with centroid-centroid distances of 3.682 (3) Å and 3.643 (3) Å.

## **S2. Experimental**

For the preparation of the title compound, disodium maleonitriledithiolate (458 mg, 2.46 mmol) and nickel chloride hexahydrate (230 mg, 0.96 mmol) were mixed by stirring in EtOH (20 ml) at room temperature. Subsequently, a solution of (E)-1-(3,4-di-chlorobenzylideneamino)-4-methylpyridinium iodide (2143 mg, 2.46 mmol) in EtOH (10 ml) was added to the mixture, and the red precipitate immediately formed was filtered off, and washed with EtOH. The crude product was recrystallized in acetone (20 ml) to give black crystals. Crystals suitable for X-ray analysis were obtained by diffusing diethyl ether into the solution of the title compound in acetone for 8 d. FT-IR data (KBr pellets, cm<sup>-1</sup>): 2189 (s), 2920 (s),1631(s), 1485 (s), 1272 (s).

## S3. Refinement

H atoms were positioned geometrically, with C-H = 0.93 and 0.96 Å for aromatic and methyl H, respectively, and constrained to ride on their parent atoms, with  $U_{iso}(H) = xU_{eq}(C)$ , where x = 1.5 for methyl H and x = 1.2 for aromatic H atoms.

# Figure 1

The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level [symmetry code (A): 1 - x, -y, 1 - z].

# Figure 2

A partial packing diagram of the title compound. Hydrogen bonds are shown as dashed lines.

$\Delta \rho_{\rm min} = -0.37 \text{ e } \text{\AA}^{-3}$

### Special details

**Geometry**. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement**. Refinement of  $F^2$  against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on  $F^2$ , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating *R*-factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. *R*-factors based on  $F^2$  are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
