## **8-Chloro-4-cyclohexyl-2H-1,4-benzoxazin-3(4H)-one**

**Zhu-Bo Li, Xiao-Yan He, Wen-Liang Dong and Dan-Dan Liao**

### **S1. Comment**

As part of our project on the study of the interactions between small molecules and proteins (Li *et al.*; 2008 and Zuo *et al.*; 2008), we report here the synthesis and crystal structure of the title compound.

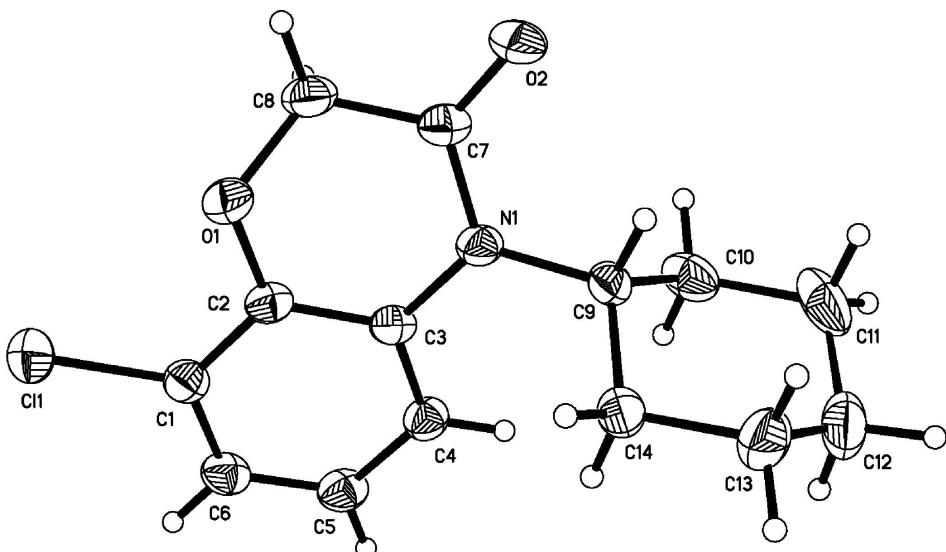

In the crystal structure of title compound,  $C_{14}H_{16}ClNO_2$ , the cyclohexyl ring is in a chair conformation. The molecules are connected via two weak C-H $\cdots$ O hydrogen bonds into dimers which are located on centres of inversion.

### **S2. Experimental**

To a solution of *N*-cyclohexyl-2-(2,3-dichlorophenoxy)acetamide(0.604 g, 2.0 mmol) in DMF (20 ml), caesium carbonate (0.787 g, 2.4 mmol) was added. The mixture was refluxed for 2 h. After completion of the reaction (by TLC monitoring), the DMF was removed under vacuum. Water (20 ml) was added into to obtain a turbid solution and it was extracted by ethyl acetate (20 ml  $\times$  4). The combined organic layer was washed by 1 mol/L of hydrochloric acid (10 ml  $\times$  3) and saturated sodium chloride solution (10 ml  $\times$  3), dried over  $MgSO_4$ . And then the mixture was filtered and the filtrate obtained was concentrated under reduced pressure to obtain the corresponding crude product. The product was purified by column chromatography on silica gel using ethylacetate = 1/5 as eluent (yield 72%). Crystals suitable for X-ray diffraction were obtained by slow evaporation of a solution of the solid dissolved in ethyl acetate/hexane at room temperature for 10 days.

### **S3. Refinement**

All H atoms were placed in calculated positions and refined as riding, with C—H = 0.93–0.97 Å and with  $U_{iso}(H)=1.2U_{eq}(C)$ .

**Figure 1**

The molecular structure of the title compound with labeling and displacement ellipsoids drawn at the 50% probability level.

0 restraints

Primary atom site location: structure-invariant  
direct methods

Secondary atom site location: difference Fourier  
map

Hydrogen site location: inferred from  
neighbouring sites

H-atom parameters constrained  
 $w = 1/[\sigma^2(F_o^2) + (0.0412P)^2 + 0.4617P]$   
 where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} < 0.001$   
 $\Delta\rho_{\max} = 0.15 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.25 \text{ e } \text{\AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
