Correspondence e-mail: humin@zzuli.edu.cn

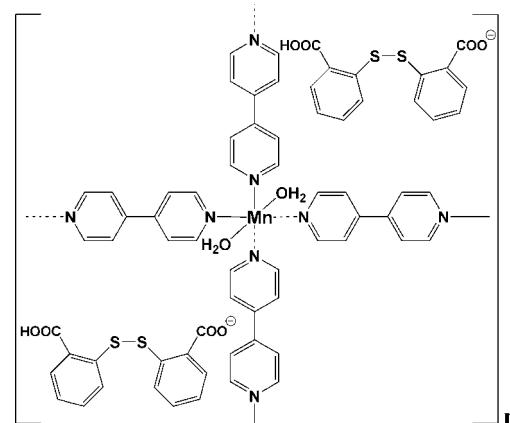

Received 9 March 2009; accepted 10 April 2009

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.032; wR factor = 0.081; data-to-parameter ratio = 12.9.

The title complex, $\{[\text{Mn}(\text{C}_{10}\text{H}_8\text{N}_2)_2(\text{H}_2\text{O})_2](\text{C}_{14}\text{H}_9\text{O}_4\text{S}_2)_2\}_n$, contains an octahedrally coordinated Mn^{II} cation and 2-(2-carboxyphenyl)disulfanyl)benzoate anions. The Mn^{II} center is situated on a crystallographic center of inversion and is coordinated by four 4,4'-bipyridine (4,4'-bipy) ligands and two water molecules. The 4,4'-bipy ligands act as bridging ligands, producing a fishing-net-like two-dimensional framework. In the crystal structure, this positively charged framework is charge balanced by 2-(2-carboxyphenyl)disulfanyl)benzoate anions that form a separate anionic two-dimensional framework via intermolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds and $\text{C}-\text{H}\cdots\pi$ stacking interactions. Additional intermolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds link the cationic and anionic frameworks to form the three-dimensional crystal structure.

Poly[[diaquabis(μ_2 -4,4'-bipyridine)manganese(II)] bis[2-(2-carboxyphenyl-disulfanyl)benzoate]]

Min Hu, Song-Tao Ma, Liang-Qi Guo and Shao-Ming Fang

S1. Comment

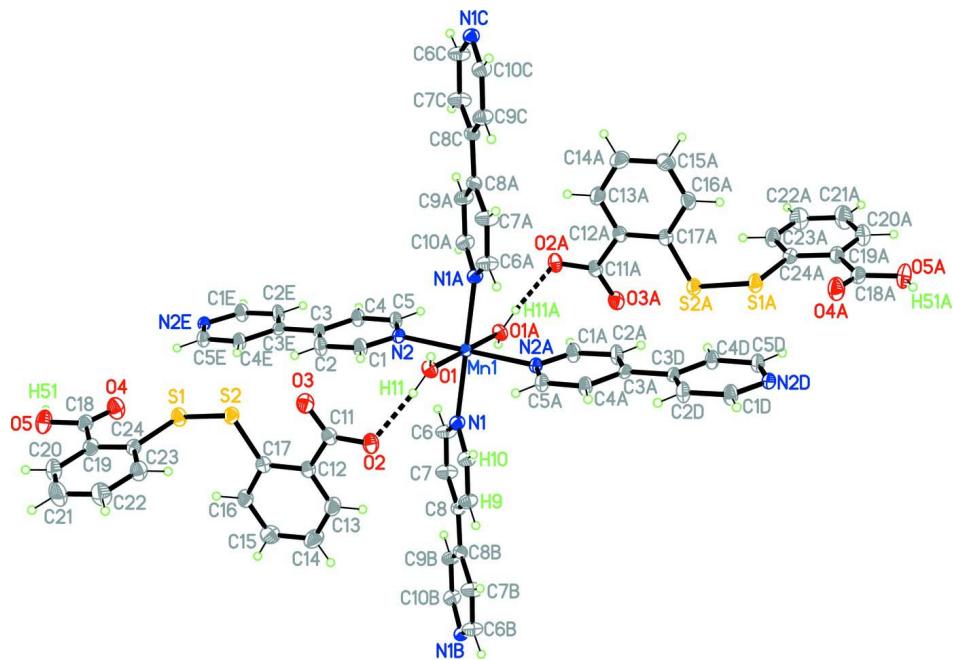

Rational design and synthesis of novel coordination polymers have achieved considerable progress in the field of supramolecular chemistry and crystal engineering. (James, 2003; Kitagawa *et al.*, 2004; Steel, 2005; Ye *et al.*, 2005). Particularly classical ligands are represented such as 4,4'-bipy. Numerous polymeric transition metal complexes with 4,4'-bipy have been synthesized and structurally characterized to date. 4,4'-bipyridine is an ideal connector between transition metal atoms for the propagation of coordination networks due to its two potential binding sites (Denning *et al.*, 2008; Hoffart *et al.*, 2007; Zhang *et al.*, 2007; Qin *et al.*, 2007; Noro *et al.*, 2002; Biradha *et al.*, 2006). During our investigation of the assembly of metal ions and mixed ligands (4,4'-bipyridine and 2,2'-dithiodibenzoic acid), we did not obtain the expected compound. The title complex, $\{[\text{Mn}(\text{C}_{10}\text{H}_8\text{N}_2)_2(\text{H}_2\text{O})_2](\text{C}_{14}\text{H}_9\text{O}_4\text{S}_2)_2\}_n$, (I) was synthesized. In contrast to many metal-organic framework materials containing 2,2'-dithiodibenzoic acid, the anions in I do not act as bridging ligands, but rather as extraframework guest molecules (Murugavel *et al.*, 2001; Zhao *et al.*, 2004; Humphrey *et al.*, 2004; Wang *et al.*, 2004). In the title crystal structure, each Mn^{II} center is separated by 4,4'-bipy spacers to give a large rhombic arrangement with each metal ion adopting an octahedral environment by binding to four 4,4'-bipy ligands and two water molecules (Fig. 1). All of the 4,4'-bipy molecules act as doubly bridging ligands. Mn^{II} centers are bridged by 4,4'-bipy ligands to form a fishing-net like, two-dimensional framework (Fig. 2). In the crystal structure, the positively charged framework of I is charge balanced by 2-*o*-benzoato-disulfanyl-benzoic acid anions. Intermolecular O—H···O hydrogen bonds and C—H···π stacking interactions (Table 1) (Fig. 3) between anions link them to form a two-dimensional framework. Intermolecular O—H···O hydrogen bonds link the cationic and anionic frameworks (Fig. 1, Table 1) to form the observed crystal structure.

S2. Experimental

A solution of 4,4'-bipy (0.05 mmol) and 2,2'-dithiodibenzoic acid (0.05 mmol) in CH₃OH (10 ml) in the presence of excess 2,6-dimethylpyridine (*ca.* 0.05 ml for adjusting the pH value of the reaction system to basic conditions) was carefully layered on top of an aqueous solution (15 ml) of Mn(ClO₄)₂ (0.1 mmol) in a test tube. Yellow single crystals suitable for X-ray analysis appeared at the tube wall after *ca.* one month at room temperature (yield ~30% based on 4,4'-bipy). Elemental analysis calculated for (C₄₈H₃₈MnN₄O₁₀S₄): H 3.78 C 56.86 N 5.53%; found: H 3.52, C 56.62, N 5.34%. IR (KBr pellet, cm⁻¹): 3094br, 1690*m*, 1594vs, 1540 s, 1457*m*, 1412*m*, 1377 s, 1306w, 1258 s, 1232*m*, 1171w, 1144*m*, 1037*m*, 1000w, 903w, 806*m*, 742 s, 689*m*, 649w, 622*m*, 542w, 468w.

S3. Refinement

H atoms were included in calculated positions and treated in the subsequent refinement as riding atoms, with C—H = 0.93 Å and O—H = 0.82 (carboxylic) or 0.85 Å (water), and with Uiso(H) = 1.2Ueq(C) and 1.5Ueq(O).

**Figure 1**

The molecular structure of (I), showing the atom-labelling scheme and the intermolecular O–H···O hydrogen-bonding interactions. Displacement ellipsoids are drawn at the 30% probability level. The atoms labelled with the suffixes A, B, C, D, and E are generated by the symmetry operations $(-x, -y, 1-z)$, $(-x, -y+1, -z+1)$, $(-x, y-1, z)$, $(x, y, z+1)$, and $(-x, -y, -z)$, respectively.

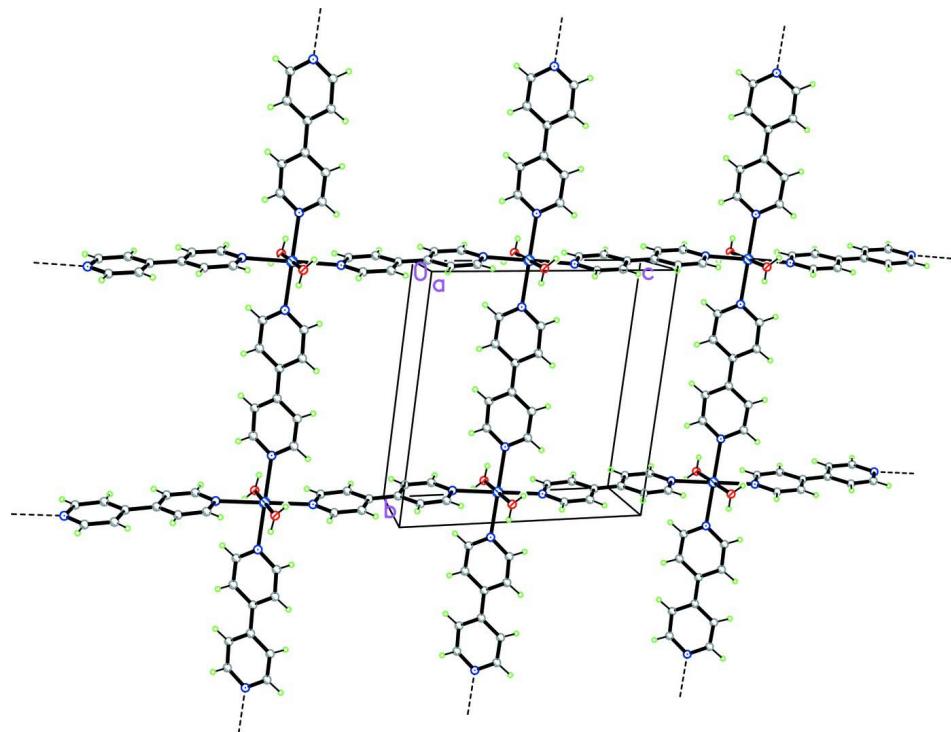

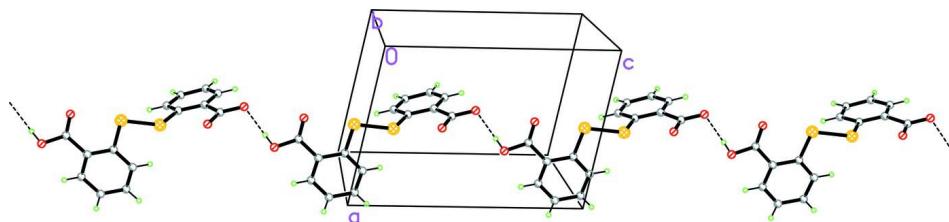

Figure 2

Cationic two-dimensional network, parallel to the (001) plane, formed by $[\text{Mn}(4,4'\text{-bipy})_4(\text{H}_2\text{O})_2]$ units.

**Figure 3**

Anionic two-dimensional network, parallel to the (100) plane, formed by intermolecular O—H \cdots O hydrogen bonds and C—H \cdots π stacking interactions between 2-*o*-benzoato-disulfanyl-benzoic acid anions.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
