Received 18 June 2009; accepted 24 June 2009

Key indicators: single-crystal X-ray study;  $T = 200$  K; mean  $\sigma(\text{C–C}) = 0.003 \text{ \AA}$ ;  $R$  factor = 0.018;  $wR$  factor = 0.041; data-to-parameter ratio = 18.2.

The title compound,  $\text{C}_6\text{H}_{16}\text{N}_3^+\cdot\text{Br}^-$ , is the bromide of the monoprotonated azamacrocyclic triamine 1,4,7-triazacyclononane (tacn). The threefold axis of the triamine is broken by the protonation of one of the three amine functions. The ammonium proton is bonded in an intramolecular symmetrically bifurcated hydrogen bond to the two endodentate amine functions. Direct cation–anion contacts are established via  $\text{N–H}\cdots\text{Br}$  hydrogen bonds between the bromide anions and  $\text{tacnH}^+$  cations.

**Related literature**

The title compound was prepared according to a published procedure (Hay & Norman, 1979; McAuley *et al.*, 1984; Battle *et al.*, 2005) following a Richman–Atkins synthesis (Richman & Atkins, 1974). For the crystal structures of related compounds, see: Warden *et al.* (2004). A symmetrically bifurcated intramolecular hydrogen bond to the two endodentate amine functions was also found in  $\text{Me}_3\text{tacnH}^+$ , see: Wieghardt *et al.* (1987).

## 4,7-Diaza-1-azoniacyclononane bromide

Thorsten Allscher, Peter Klüfers and Christine Neumann

### S1. Comment

1,4,7-Triazacyclononane is a popular ligand in coordination chemistry due to its  $C_3$  symmetry and its propensity for facial coordination to metal ions. Although about 1500 crystallographically characterized tacn-metal complexes are known from the literature, it was not before 2005 that the crystal structure of the free parent triamine was determined (Battle *et al.*, 2005). Warden *et al.* (2004) described five salts of the threefold protonated triamine and different anions. The herein reported structure is an AB-type salt of the monoprotonated triamine and bromide counterions. The asymmetric unit contains one ion pair. Additionally, in Fig. 1 the symmetrically bifurcated intramolecular hydrogen bond to the two endodentate amine functions is shown. This bond type, also found by Wieghardt *et al.* (1987) for  $\text{Me}_3\text{tacnH}^+$ , accounts for the stabilization of the monoprotonation and may have contributed to the difficulty to isolate the free parent triamine.

The structure is built by bilayers that are held together by van der Waals attraction. No classical hydrogen bonds were found between the bilayers. In contrast, the bilayer itself is connected by N—H $\cdots$ Br hydrogen bonds which link two  $\text{tacnH}^+$  cations of the one layer and one  $\text{tacnH}^+$  cation of the adjacent layer *via* a bromide counterion. An additional C—H $\cdots$ Br hydrogen bond connects the  $\text{tacnH}^+$  cations of each monolayer with the bromide (Fig. 2).

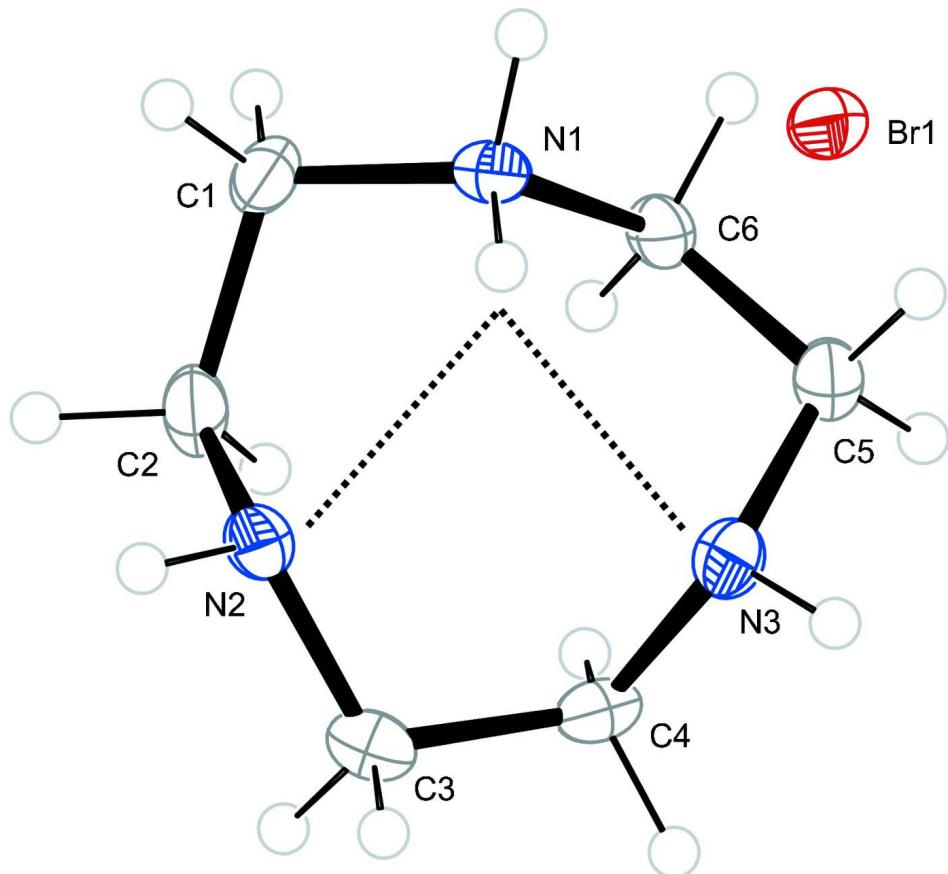

Fig. 3 shows the packing along [0 0 1] which is more reminiscent of the structure of tacn hemihydrate (Battle *et al.*, 2005) than of the structures of the  $\text{tacnH}^{3+}$  salts which are characterized by a higher hydrogen-bond density (Warden *et al.*, 2004).

### S2. Experimental

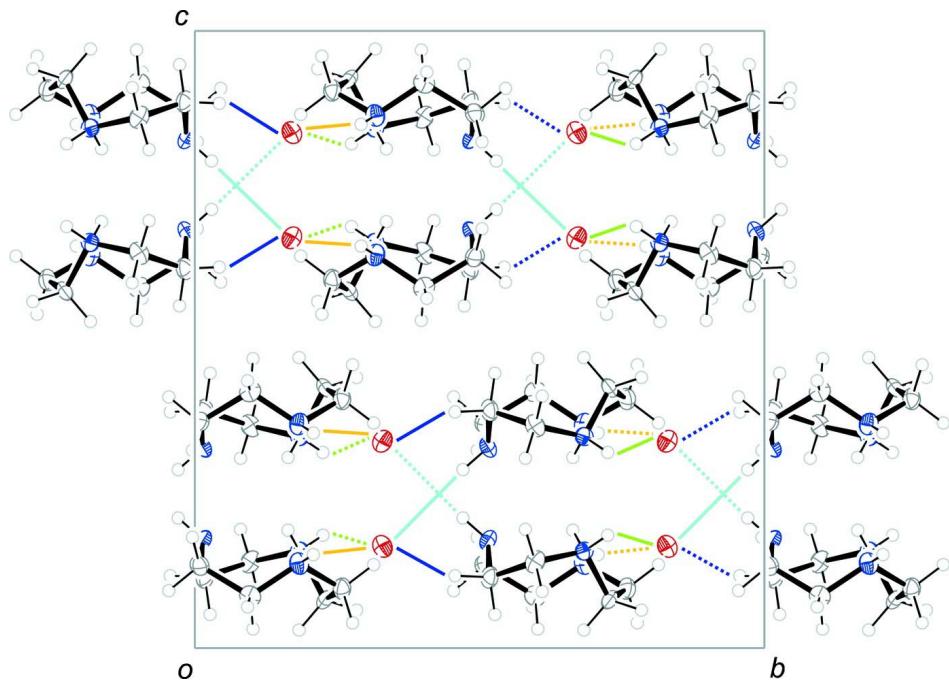

By following the Richman-Atkins synthesis (Richman *et al.*, 1974), 1,4,7-triazacyclononane was prepared by a method which utilizes the high degree of cyclization achieved by the reaction of the disodium salt of  $N,N',N''$ -tritosyldiethyl-enetriamine with the ditosyl derivative of 1,2-ethanediol (Hay *et al.* (1979); McAuley *et al.* (1984); Battle *et al.* (2005)). Crystals of the title compound suitable for X-ray analysis were recovered from the filtration residue of the toluene fraction which was extracted and recrystallized with acetone.

### S3. Refinement

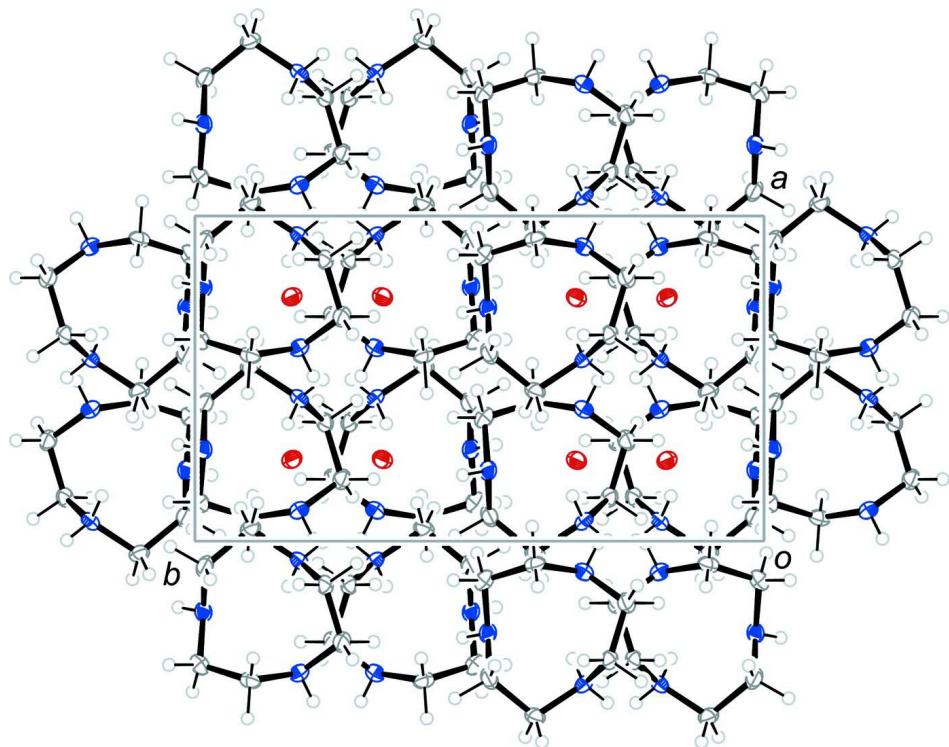

$\text{CH}_2$  and the  $\text{NH}_2$  hydrogen atoms were placed in calculated positions and were included in the refinement in the riding model approximation with C—H distances of 0.99 Å and N—H distances of 0.92 Å. The positions of the amine hydrogen atoms were refined with N—H distances restrained to 0.90 (1) Å. All  $U_{\text{iso}}(\text{H})$  values were set to 1.2  $U_{\text{eq}}(\text{C}/\text{N})$ . The presence of pseudo-symmetry indicated by superstructure reflections along  $b$  suggested a higher symmetry space group  $Pbcm$ . Attempts to refine the structure in the space group  $Pbcm$  have however resulted in a disordered model with significant higher R and wR values.

**Figure 1**

The molecular structure of the title compound, with atom labels and anisotropic displacement ellipsoids (drawn at 50% probability level) for non-H atoms. The intramolecular symmetrized bifurcated hydrogen bond is drawn as a broken line.

**Figure 2**

The crystalline packing of the title compound (50% probability displacement ellipsoids), viewed along [1 0 0]. Note the hydrogen-bonded chains along [001]. Color codes: N1—H···Br green, N2—H···Br blue, N3—H···Br yellow, C2—H···Br violet.

**Figure 3**
