Received 10 August 2009; accepted 12 August 2009
Key indicators: single-crystal X-ray study; $T=294 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.005 \AA$; $R$ factor $=0.065 ; w R$ factor $=0.196$; data-to-parameter ratio $=13.8$.

The Schiff base, $\mathrm{C}_{16} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{~S}_{2}$, has been synthesized by refluxing an ethanolic solution of thiophene-2-carbaldehyde and benzene-1,4-diamine. The center of the benzene ring is located on a crystallographic center of inversion. The dihedral angle between the benzene and thiophene rings is $63.6(1)^{\circ}$.

## $N, N^{\prime}$-Bis(2-thienylmethylene)benzene-1,4-diamine

Nai-Wei Dong, Dong-Xue Jia, Chun-Li Gan, Dong-Mei Zhou and Feng-Zhi Liu

## S1. Comment

During the past decades, Schiff bases have been intensively investigated not only because of their strong coordination capability but also due to diverse biological activities, such as e.g. antibacterial and antitumor activities (Andersen et al., 2005; Koizumi et al., 2005; Boskovic et al., 2003; Oshio et al., 2005). Here we report the structure of N,N'-bis-thio-phene-2-yl-methylene-1,4-benzenediamine, which could be used as another Schiff base ligand in combination with metal ions.
The molecular structure of the title compound is depicted in Figure 1. The center of the phenyl ring represents a crystallographic center of inversion. The dihedral angle between the phenyl and thiophene rings is $63.6(1)^{\circ}$. As it is expected the thiophene rings also are perfectly planar with a deviation of the S atom of $0.001 \AA$.

## S2. Experimental

N, $\mathrm{N}^{\prime}$-Bis-thiophene-2-yl-methylene-1,4-benzenediamine was prepared according to the method reported in the literature (Kannappan et al., 2005). Thiophene-2-carboxaldehyde ( 0.02 mol ) was added to a stirred ethanolic solution of $p$-phenylenediamine ( 0.01 mol ). The reaction mixture was stirred about 3 h and then the mixture was allowed to stand at room temperature for about two days. Yellow crystals suitable for X-ray diffraction analysis were collected with a yield of $60 \%$. Anal. Calc. for $\mathrm{C}_{16} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{~S}_{2}$ : C 64.78, H 4.05, N 9.45\%; Found: C 64.59, H 4.01, N 9.25\%.

## S3. Refinement

All H atoms were placed in calculated positions with $\mathrm{C}-\mathrm{H}=0.93 \AA$ and refined as riding with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}($ carrier $)$.

## Figure 1

View of the molecular structure of the title compound, showing the atomic numbering scheme and $50 \%$ probability displacement ellipsoids. Atoms labeled with A at the symmetry positions $(-x+1,-y+1,-z+1)$.

91 parameters
0 restraints
Primary atom site location: structure-invariant direct methods

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
