Received 7 September 2009; accepted 21 September 2009

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.012\text{ \AA}$ ; disorder in solvent or counterion;  $R$  factor = 0.078;  $wR$  factor = 0.216; data-to-parameter ratio = 12.7.

The centrosymmetric title compound,  $[\text{Cu}_2(\text{C}_{10}\text{H}_8\text{N}_2)_2(\text{C}_{25}\text{H}_{22}\text{P}_2)_2](\text{BF}_4)_2$ , consists of discrete dinuclear cations and tetrafluoroborate anions. The two Cu<sup>I</sup> centers are bridged by the phosphine ligands to form an eight-membered ring. The Cu<sup>I</sup> center exhibits a tetrahedral coordination as it is chelated by the *N*-heterocycle.

## Bis[ $\mu$ -bis(diphenylphosphino)methane- $\kappa^2P:P'$ ]bis[(2,2'-bipyridine- $\kappa^2N,N'$ )copper(I)] bis(tetrafluoroborate)

Shouwen Jin and Daqi Wang

### S1. Comment

The bis(diphenylphosphino)methane (dppm) is an important bridging ligand. During the past decade transition metal chemistry of dppm have been widely studied. A large number of binuclear metal complexes containing dppm are known with a variety of photophysics and stereochemistry (Diez *et al.*, 1987; Stockland *et al.*, 2001; Yam *et al.*, 1997).

Copper(I) complexes, which are inexpensive, abundant, and as strongly emissive as  $d^{10}$  Au(I) complexes, have received increased attention (Armaroli, 2001). As we are interested in research of Cu<sup>I</sup> complexes containing N-heterocyclic compound and phosphine compounds (Jin *et al.*, 2008). To obtain further insight into this very interesting field of research, we therefore decided to initiate an investigation on substituting the dppe(bis(diphenylphosphino)ethane) with dppm. In this work, we report on the reaction of  $[Cu_2(dppm)_2(CH_3CN)_2](BF_4)_2$  with 2,2'-bipyridine, as well as the structure of  $[Cu_2(dppm)_2(L)_2]_2(BF_4)_2$ .

The complex was prepared by reacting equal mol of  $[Cu_2(dppm)_2(CH_3CN)_2](BF_4)_2$ , and 2,2'-bipyridine (*L*) in dry ethanol solution. This procedure, frequently used for the preparation of copper(I) complexes containing both N-heterocyclic compounds and triphenylphosphine ligands, gave dinuclear complex of the formula  $[Cu_2(PPh_3)_4L](BF_4)_2$  (Jia *et al.*, 2005). The compound is an ionic compound which consists of dimeric  $[Cu_2(\mu\text{-}dppm)_2(L)_2]^{2+}$  cations, and of tetra-fluoroborate anions. The asymmetric unit of dimeric  $[Cu_2(\mu\text{-}dppm)_2(L)_2]^{2+}$  cations contains a half of the cations including a Cu<sup>I</sup> atom, one 2,2'-bipyridine, and one bis(diphenylphosphino)methane of which the phosphorus donor atoms are in *cis*-bound position. The structure of the cation is depicted in Fig. 1 together with the atomic numbering scheme. Two copper atoms are doubly bridged by two dppm ligands to form an eight-membered Cu<sub>2</sub>P<sub>4</sub>C<sub>2</sub> ring, which displays chair conformation. The slightly distorted tetrahedral coordination around the copper atom is completed by two nitrogen atoms from chelate 2,2'-bipyridine ligands. Copper atoms doubly bridged by two dppm ligands have been found also in  $[Cu_2(\mu\text{-}dppm)_2(MeCN)_4][ClO_4]_2$  (Diez *et al.*, 1987), although the Cu—Cu separation of 4.599 Å in this investigation is longer than that found in complex  $[Cu_2(\mu\text{-}dppm)_2(MeCN)_4][ClO_4]_2$  (3.757 (3) Å) (Diez *et al.*, 1987), which may be due to the crowding of the coordinated 2,2'-bipyridine. The corresponding Cu—N bond lengths are 2.094 (6), and 2.106 (5) Å respectively being much similar to Cu—N (2.104 (3) Å) bond distance of  $[Cu(dmp)(DPEphos)]BF_4$  (Kuang *et al.*, 2002). Also the two Cu—P bonds have a significant difference, one Cu—P bond (Cu(1)—P(2) 2.238 (2) Å) in the title compound is shorter than those in  $[Cu_2(\mu\text{-}dppm)_2(MeCN)_4][ClO_4]_2$  (2.270 (3) and 2.283 (3) Å), another Cu—P (Cu(1)—P(1) 2.283 (2) Å) bond is almost the same with the value in  $[Cu_2(\mu\text{-}dppm)_2(MeCN)_4][ClO_4]_2$  (Diez *et al.*, 1987). The irregularities in the tetrahedral coordination geometry about the copper(I) center are best reflected in the values of the bond angles, since only three of them are close to the ideal tetrahedral value. For the  $d^{10}$  complexes, the P—M—P units are distinctly nonlinear and  $M_2P_4$  skeletal units are not coplanar (Ho & Bau, 1983), our compound conforms with this case also. As expected, the largest angle P(2)—Cu(1)—P(1) (136.81 (6) °) which is larger than the corresponding value in

$[\text{Cu}_2(\mu\text{-dppm})_2(\text{MeCN})_4][\text{ClO}_4]_2$  (Diez *et al.*, 1987) arises between the two most bulky ligands.

## S2. Experimental

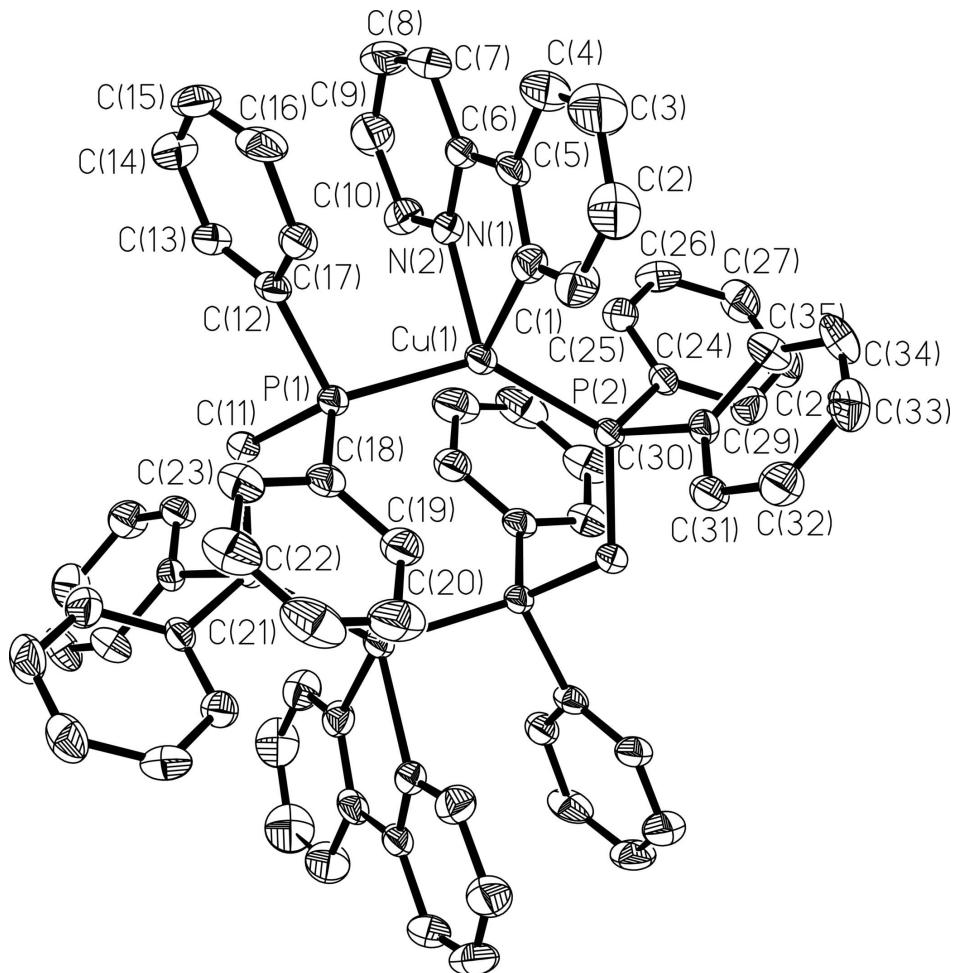

The CHN elemental analyses were performed on a Perkin-Elmer elemental analyzer.

To a solution of 2,2'-bipyridine (0.032 g, 0.2 mmol) in 10 ml of ethanol was added  $[\text{Cu}_2(\text{dppm})_2(\text{CH}_3\text{CN})_2](\text{BF}_4)_2$  (0.180 g, 0.2 mmol). The mixture was stirred at room temperature overnight to afford a yellow solid, which was collected by filtration, washed with ethanol and ether, Yield: 0.148 g, 53.5%. Anal. Calcd. for  $\text{C}_{70}\text{H}_{66}\text{B}_2\text{Cu}_2\text{F}_8\text{N}_4\text{P}_4$ : C, 60.83%, H, 4.34%, N, 4.06%. Found: C, 60.81%, H, 4.28%, N, 4.13%. Suitable crystals were grown by slow diffusion of diethyl ether to its DMF solution.

## S3. Refinement

All H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms, with C—H = 0.93–0.97 Å, and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

The largest peak/hole in the difference Fourier map are 1.435 and -0.802 respectively.

**Figure 1**

The structure of the dimeric cation, showing the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional R-factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and R-factors based on ALL data will be even larger.
