2,2'-Dimethoxy-6,6'-dinitrobiphenyl

Shao-Bin Miao, Dong-Sheng Deng, Xian-Ming Liu and Bao-Ming Ji*

College of Chemistry and Chemical Engineering, Luoyang Normal University, Luoyang 471022, People's Republic of China Correspondence e-mail: lyhxxjbm@126.com

Received 28 July 2009; accepted 24 August 2009

Key indicators: single-crystal X-ray study; T = 294 K; mean σ (C–C) = 0.002 Å; *R* factor = 0.035; *wR* factor = 0.097; data-to-parameter ratio = 12.9.

In the title compound, $C_{14}H_{12}N_2O_6$, the half molecule in the asymmetric unit of the cell is completed by a crystallographic twofold rotation axis, and the two benzene rings of the complete molecule make a dihedral angle of $60.5 (3)^\circ$. Furthermore, intermolecular weak $C-H\cdots O$ hydrogen bonds link adjacent molecules, forming a two-dimensional sheet. These sheets are stablized by face-to-face weak $\pi-\pi$ contacts [centroid–centroid distance = 3.682 (1) Å] between the nearly parallel [dihedral angle = $0.12 (7)^\circ$] benzene rings of the neighboring molecules, resulting in a three-dimensional network.

S1. Comment

A large number of chiral compounds with C_2 -symmetry are widely used as chiral auxiliaries and ligands in asymmetric synthesis and have shown high stereocontrol properties in a wide range of asymmetric transformations (Jiang *et al.* 2001; García *et al.* 2002). Design and synthesis of such compounds play a very important role in the development of highly enantioselective asymmetric reactions. Thus, it is not surprising that a lot of methods have been developed to obtain these chiral compounds (Brunel 2005; Kočovský *et al.* 2003). In this paper, we report the synthesis and crystal structure of the title compound with C_2 -symmetry.

A view of the molecular structure of the title compound is given in Fig.1. All bond lengths and angles are in the expected range and in good agreement with those reported previously (Yang *et al.* 2005). The dihedral angle between two benzene rings is $60.5 (3)^\circ$, which is considerable larger than those found in other biphenyls (Fischer *et al.* 2007), possibly due to the concomitant effects of the steric hindrance of adjacent methoxy and nitro groups.

In the crystal structure, each molecule is connected by four adjacent molecules through intermolecular C—H···O hydrogen bonds (Table 1), between methoxy groups and O atoms of the adjacent nitro groups, leading to the formation of a two-dimensional sheet in the *ac* plane. The sheets are further connected into a three-dimensional network(Fig.2) by the face-to-face weak π - π contacts between nearly parallel benzene rings of the neighboring title molecules. The *Cg*1···*Cg*1ⁱⁱⁱ distance is 3.6823 (11) Å, the perpendicular distance between the rings is 3.410 Å, and the slippage between the rings is 1.389 Å. *Cg*1 is the centroid of the benzene ring C1 - C6, the symmetry code iii = 1 - *x*, -*y*, 1 - *z*.

S2. Experimental

The title compound was synthesized by a reported method (Chen, *et al.* 2001),namely, a mixture of 2-iodo-3-nitroanisol (14 g, 0.05 mol) and activated copper brone (9.5 g, 0.15 mol), 50 ml of dimethylformamide was stirried at 140°C for 4 h under nitrogen atmosphere. Yellow crystals suitable for X-ray diffraction study were obtained from a solution in acetic ester.

S3. Refinement

All of the non-hydrogen atoms were refined anisotropically. The hydrogen atoms were assigned with common isotropic displacement factors $U_{iso}(H) = 1.2$ times $U_{eq}(C,N)$ and 1.5 times $U_{eq}(O)$, respectively, and included in the final refinement by using geometrical restraints, with C–H distances of 0.93 Å.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2 , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
