Received 28 September 2009; accepted 15 October 2009

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$ ;  
 $R$  factor = 0.094;  $wR$  factor = 0.174; data-to-parameter ratio = 18.1.

In the asymmetric unit of the crystal structure of the title compound,  $\text{C}_{16}\text{H}_{17}\text{Cl}_3\text{N}_3\text{O}_2\text{P}$ , there are two crystallographically independent molecules, which form dimers *via* N—H···O hydrogen bonding between the N—H group and the P=O group. In the molecular structure, the phosphoryl group is *anti* to the carbonyl group. The two benzene rings are oriented at dihedral angles of 54.3 (2) and 49.7 (2) $^\circ$  in the two independent molecules.

## N-{Bis[methyl(phenyl)amino]phosphoryl}-2,2,2-trichloroacetamide

Kateryna O. Znoviyak, Vladimir A. Ovchynnikov, Tetyana Yu. Sliva, Svitlana V. Shishkina and Vladimir M. Amirkhanov

### S1. Comment

The intensive development of the chemistry of the phosphorus containing systems during the last decades has given rise to synthesis of many compounds bonded by phosphorus and nitrogen atoms (Helm *et al.*, 1999; Katti *et al.*, 1991). Carbacylamidophosphates, which have CONHPO in molecular core unit, have attracted attention because of their using in pharmacology, as insecticides, pesticides and ureas inhibitor (Jaroslav *et al.*, 1985). These types of compounds are used as ligands, particularly for lanthanides (Oczko *et al.*, 2003), actinides (Amirkhanov *et al.*, 1997) and 3d-metals (Trush *et al.*, 2003; Gubina *et al.*, 2002). Thus to date the syntheses and structures of carbacylamidophosphate compounds have been of increased interest (Gholivand *et al.*, 2008a). This paper is devoted to the crystal structure of *N*-{bis[methyl(phenyl)amino]phosphoryl}-2,2,2-trichloroacetamide (HL).

The title compound contains two crystallographically independent molecules in the asymmetric unit of the unit cell, which aggregate into the non-centrosymmetric dimers (HL)<sub>2</sub> formed by the hydrogen bonds of N—H···OP (Figs. 1 and 2, Table 1). In the crystal structure of the HL the phosphoryl and carbonyl groups are in an *anti*-position to each other as in the most of the carbacylamidophosphates (Gubina *et al.*, 1999). The bond distances P(1)O(11) and P(2)O(21) are typical for compounds with amide substituents close to phosphorus atoms (1.465–1.482 Å) (Rebrova *et al.*, 1982). The values of CO and C—N bonds lie in the ranges 1.193 (8) Å, 1.207 (8) Å and 1.365 (9) Å, 1.362 (8) Å, respectively and close to the corresponding values of the carbacylamidophosphates (Gholivand *et al.*, 2008b). The P(1)—N(11) (1.684 (5) Å) and P(2)—N(21) (1.692 (5) Å) distances of HL are longer on average by 0.05 Å than P—N bond distances between amide substituents and phosphorus atoms (P(1)—N(12), P(1)—N(13), P(2)—N(22), P(2)—N(23)) which fall in the range 1.634 (4)–1.649 (4) Å.

The phosphorus atoms of HL have distorted tetrahedral configuration where the values of O—P—N angles have the highest deviation from the 109.28°. Inspection of the O(11)—P(1)—N(11) and O(21)—P(2)—N(21) angles indicates that these angles are less than tetrahedral one (105.9 (2)° and 105.4 (2)°, respectively), while others O—P—N angles indicate higher values (111.2 (2)°–119.0 (2)°), that may be explained by the repulsion of amide substituents and PO group.

### S2. Experimental

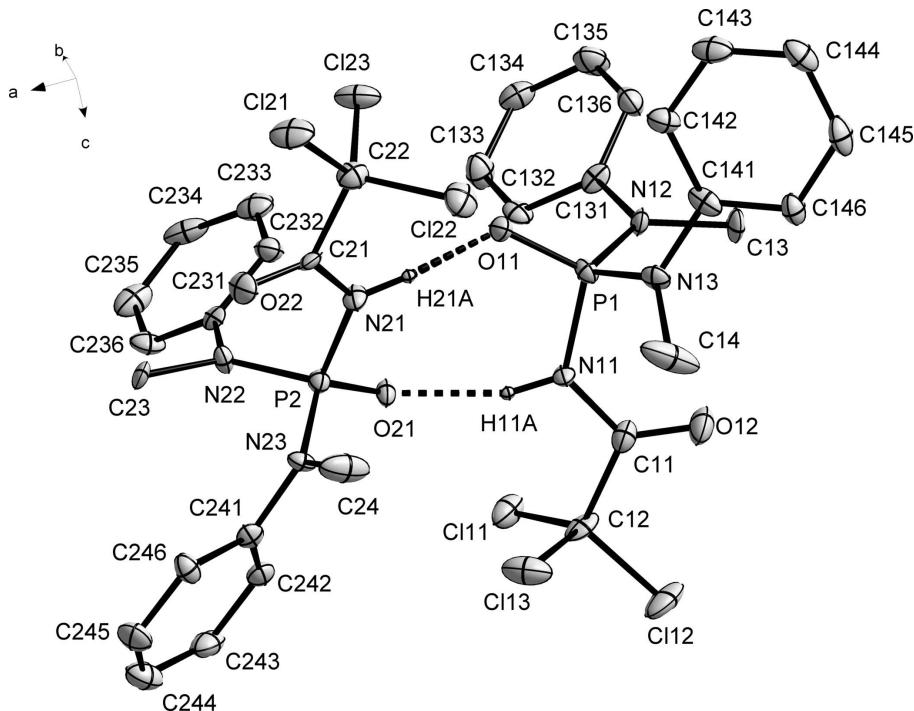

The dichloranhydride of trichloroacetylaminodiphosphoric acid was prepared according to the method reported by Kirsanov (Kirsanov *et al.*, 1956).

The dioxane solution (100 ml) of methylaniline (21.4 g, 0.2 mol) and triethylamine (20.2 g, 0.2 mol) was placed in a three-neck round-bottomed flask and cooled by ice to 268 K. Then the dioxane solution (400 ml) of dichloranhydride of trichloroacetylaminodiphosphoric acid (27.9 g, 0.1 mol) was added dropwise under vigorous stirring. The temperature was not allowed to rise above 278 K. The stirring was continued for 1 h. The formed precipitate of  $N(C_2H_5)_3HCl$  was filtered off and the filtrate evaporated. The oily precipitate of *N*-{bis[methyl(phenyl)amino]phosphoryl}-2,2,2-trichloroacetamide

was isolated and recrystallized from the 2-propanol as white crystalline powder. The colourless crystals of the HL were obtained by slow evaporation of the mother liquor, washed with cool 2-propanol (10 ml) and finally dried in air (yield 85%).

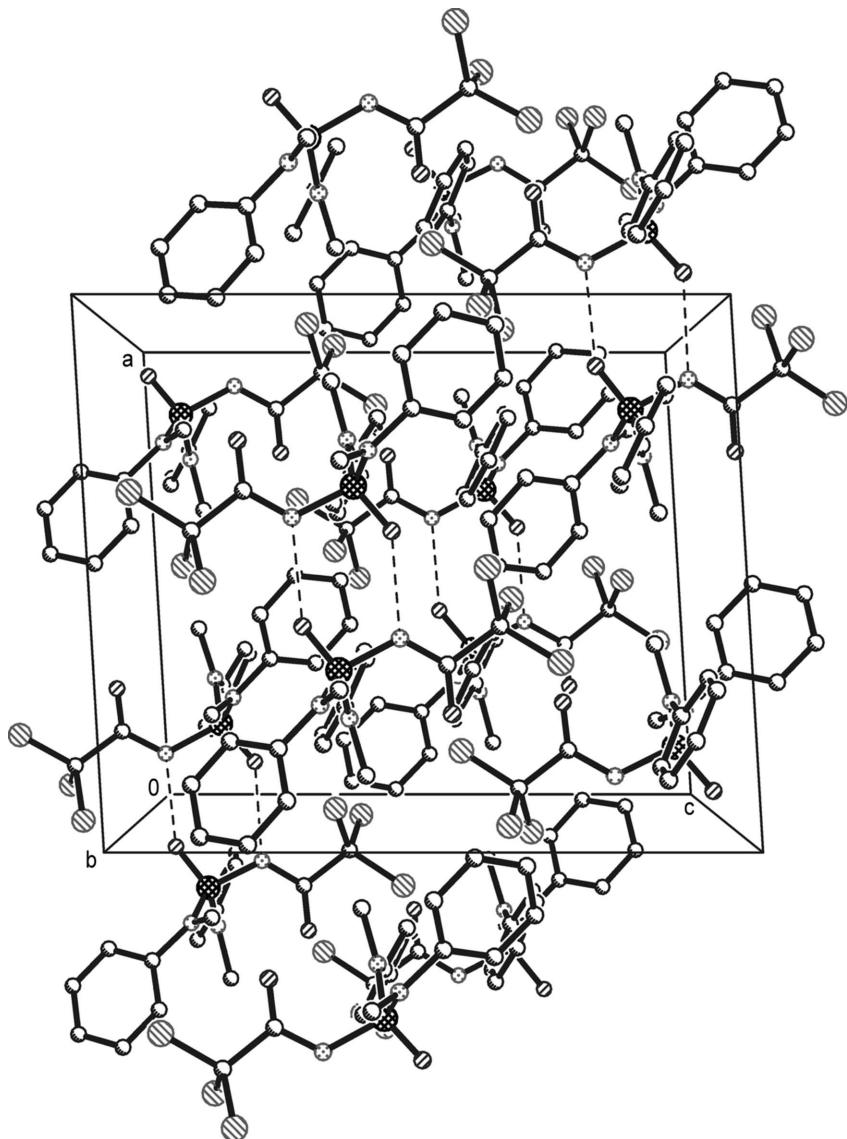

### S3. Refinement

All H atoms were placed at calculated positions and treated as riding on their parent atoms [C—H = 0.93 and 0.96 Å, and  $U_{\text{iso}}(\text{H}) = 1.2$  and  $1.5U_{\text{eq}}(\text{C})$ , N—H = 0.86 Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$ ].

**Figure 1**

A view of hydrogen bonding between the two independent molecules in the unit cell of the title compound with atom numbering scheme. Displacement ellipsoids are shown at 50% probability level. Hydrogen atoms not involved in hydrogen bonding are omitted for clarity.

**Figure 2**

A projection of packing diagram of the title compound along the  $y$ -direction.

*Special details*

**Experimental.** <sup>1</sup>H NMR, 400.13 MHz, (DMSO-*d*<sub>6</sub>): 3.06, 3.08 (d, 6H, CH<sub>3</sub>), 7.3 (m, 10H, C<sub>6</sub>H<sub>5</sub>), 10.28 (s, 1H, NH). <sup>31</sup>P NMR, 162.1 MHz, (DMSO-*d*<sub>6</sub>): 5.46 (*m*). IR (KBr pellet, cm<sup>1</sup>): 3040 (s, N—H), 2850, 1730(s, CO), 1600 (s, CC), 1470 (s, C—N), 1280, 1245, 1210(s, PO), 1090, 1039, 930, 885, 815, 700, 685 (s, C—Cl).

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
