## 2,5-Dimethylpyrazine 1,4-dioxide

Carlton J. Brown III and Jacqueline M. Knaust*

Allegheny College, Chemistry Department, 520 North Main St., Meadville, PA 16335, USA
Correspondence e-mail: jknaust@allegheny.edu
Received 4 November 2009; accepted 5 November 2009
Key indicators: single-crystal X-ray study; $T=173 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.049 ; w R$ factor $=0.144 ;$ data-to-parameter ratio $=20.5$.

The title compound, $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}_{2}$, was prepared from 2,5dimethylpyrazine, acetic acid, and hydrogen peroxide. The 2,5dimethylpyrazine 1,4 -dioxide molecule is located on an inversion center. $\pi-\pi$ interactions between neighboring $2,5-$ dimethylpyrazine 1,4-dioxide molecules are observed with an interplanar distance of 3.191 A. Each 2,5-dimethylpyrazine 1,4-dioxide molecule is linked to four neighboring $N$-oxide molecules through $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen-bonding interactions, forming two-dimensional layers.

## 2,5-Dimethylpyrazine 1,4-dioxide

## Carlton J. Brown and Jacqueline M. Knaust

## S1. Comment

The use of pyrazine $N, N^{\prime}$-dioxide in the synthesis of lanthanide coordination networks has been of recent interest (Cardoso et al. (2001), and Sun et al. (2004)). Shi, Sun et al. (2006), Shi, Zhang et al. (2006), Shi et al. (2007), Sun, Gao et al. (2005), and Sun, Wang et al. (2005) recently reported the use 2,5-dimethylpyrazine 1,4-dioxide in the synthesis of a transition metal coordination networks. The title compound was prepared using the reaction conditions described by Simpson et al. (1963) to prepare 2,2'-bipyridine $N, N^{\prime}$-dioxide.
The asymmetric unit of the title compound contains half of a 2,5-dimethylpyrazine 1,4-dioxide molecule (Figure 1) and the N -oxide molecule lies on an inversion center. $\pi$-Cloud interactions between neighboring 2,5-dimethylpyrazine 1,4dioxide molecules are observed with an interplanar distance of $3.191 \AA$ (Figure 2); there is a slippage of $2.408 \AA$ such that $\mathrm{N} 1^{\text {iii }}$ on the neighboring N -oxide molecule lies directly over the centroid of the $\mathrm{C} 3-\mathrm{N} 1^{\mathrm{i}}$ bond [symmetry codes: (i) -$x+1,-y,-z+1$; (iii) $x+1, y, z]$ (Figure 3). The title compound forms eight $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds with four neighboring N -oxide molecules, and these hydrogen bonding interactions result in the formation of two-dimensional layers (Figure 5); whereas in the related structures of 2-methylpyrazine 1,4-dioxide and pyrazine $\mathrm{N}, \mathrm{N}^{\prime}$-dioxide, the N oxide molecules form hydrogen bonded ribbons and a three-dimensional network, respectively (Gratton et al. (2009), Näther et al. (2002)). A packing diagram of the title compound is given in Figure 5.

## S2. Experimental

2,5-Dimethylpyrazine ( $6.99 \mathrm{ml}, 64.0 \mathrm{mmol}$ ), acetic acid ( 75 ml ), and $30 \%$ hydrogen peroxide ( 13 ml ) were heated at $343-353 \mathrm{~K}$ for 3 h . Additional hydrogen peroxide ( 9 ml ) was added, and heating was continued. After an additional 19 h of heating the solution was cooled to room temperature. Crystals formed upon the addition of acetone $(1 L)$ and cooling to 273 K , and were recrystallized from hot water by addition of excess acetone and cooling to 273 K .

## S3. Refinement

All H atoms were positioned geometrically and refined using a riding model with $\mathrm{C}-\mathrm{H}=0.95-0.99 \AA$ and with $U_{\text {iso }}(\mathrm{H})=$ 1.2 (1.5 for methyl groups) times $U_{\mathrm{eq}}(\mathrm{C})$.

Figure 1
The molecular structure of the title compound with atom labels and $50 \%$ probability displacement ellipsoids for non- H atoms. Atoms not labeled are generated by the symmetry operator (i) $-x+1,-y,-z+1$.

Figure 2

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
