Received 29 November 2009; accepted 14 December 2009

Key indicators: single-crystal X-ray study;  $T = 299$  K; mean  $\sigma(C-C) = 0.006$  Å; disorder in main residue;  $R$  factor = 0.062;  $wR$  factor = 0.199; data-to-parameter ratio = 12.5.

The title compound, C<sub>13</sub>H<sub>11</sub>Cl<sub>2</sub>NO<sub>2</sub>S, crystallizes with four independent molecules in the asymmetric unit. In each of the four molecules, the conformation of the N—C bond in the C—SO<sub>2</sub>—NH—C segment is *gauche* with respect to both S=O bonds. The molecules are twisted at the S—N bonds with C—SO<sub>2</sub>—NH—C torsion angles of 60.6 (4), -59.7 (3), 63.9 (4) and 53.0 (4)°. The benzene rings in two of the molecules are disordered with multiple positions resolved in each case. The crystal structure features inversion dimers linked by pairs of N—H···O hydrogen bonds for each of the four molecules.

## 2,4-Dichloro-N-(4-methylphenyl)benzenesulfonamide

B. Thimme Gowda, Sabine Foro, P. G. Nirmala and Hartmut Fuess

### S1. Comment

In the present work, as part of a study of substituent effects on the structures of *N*-(aryl)arylsulfonamides (Gowda *et al.*, 2009*a, b*), the structure of 2,4-dichloro-*N*-(4-methylphenyl)benzenesulfonamide (**I**) has been determined. The asymmetric unit of (**I**) contains four independent molecules. The conformations of the N—C bonds in the C—SO<sub>2</sub>—NH—C segment have *gauche* torsions with respect to the S=O bonds (Fig. 1). The molecules are twisted at the S—N bonds with the C—SO<sub>2</sub>—NH—C torsion angles being 60.6 (4) $^{\circ}$ , -59.7 (3) $^{\circ}$ , 63.9 (4) $^{\circ}$ , and 53.0 (4) $^{\circ}$ , respectively, compared to the values of -48.2 (2) $^{\circ}$  in 2,4-dichloro-*N*-(3,4-dichlorophenyl)benzenesulfonamide (**II**) (Gowda *et al.*, 2009*b*) and -69.7 (2) $^{\circ}$  in 2,4-di-methyl-*N*-(3,4-dichlorophenyl)benzenesulfonamide (**III**) (Gowda *et al.*, 2009*a*).

The sulfonyl benzene and the aniline benzene rings in the four molecules of (**I**) are tilted relative to each other by 85.2 (1) $^{\circ}$  (molecule 1), 80.5 (2) $^{\circ}$  (molecule 2, disordered orientation A), 80.1 (2) $^{\circ}$  (molecule 2, orientation B), 87.5 (7) (molecule 3, disordered orientation A), 87.0 (6) $^{\circ}$  (molecule 3, orientation B) and 72.4 (1) $^{\circ}$  (molecule 4), compared to the values of 68.9 (1) $^{\circ}$  in (**II**) and 82.4 (1) $^{\circ}$  in (**III**). The other bond parameters in (**I**) are similar to those observed in (**II**), (**III**) and other aryl sulfonamides (Perlovich *et al.*, 2006; Gelbrich *et al.*, 2007).

In the crystal structure, the pairs of intermolecular N—H $\cdots$ O hydrogen bonds link the molecules through inversion-related dimers, Fig. 2 and Table 1.

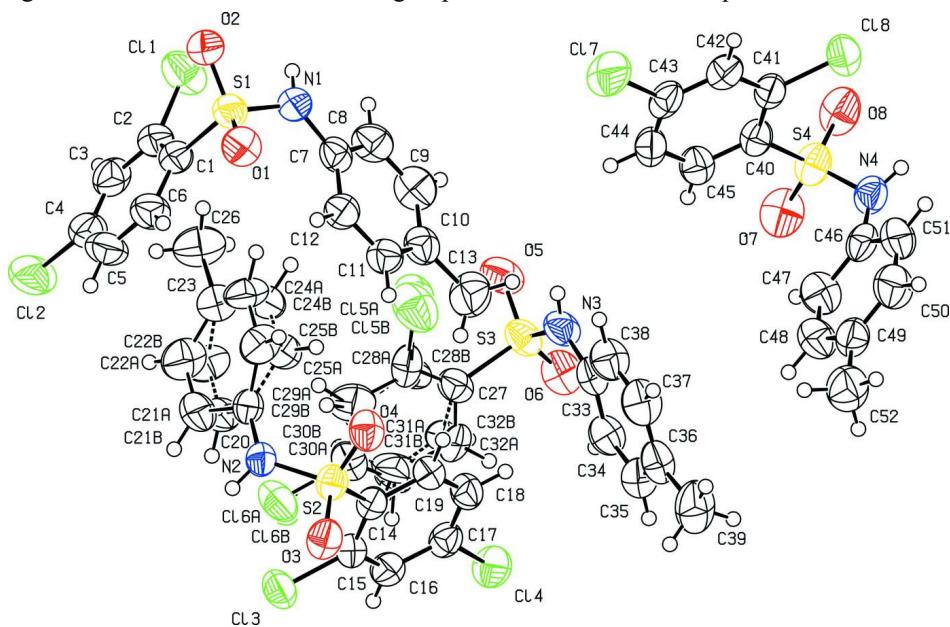

### S2. Experimental

The solution of 1,3-dichlorobenzene (10 ml) in chloroform (40 ml) was treated drop-wise with chlorosulfonic acid (25 ml) at 273 K. After the initial evolution of hydrogen chloride subsided, the reaction mixture was brought to room temperature and poured into crushed ice in a beaker. The chloroform layer was separated, washed with cold water and allowed to evaporate slowly. The residual 2,4-dichlorobenzenesulfonylchloride was treated with a stoichiometric amount of *p*-toluidine and boiled for ten minutes. The reaction mixture was then cooled to room temperature and added to ice cold water (100 ml). The resultant solid 2,4-dichloro-*N*-(4-methylphenyl)benzenesulfonamide was filtered under suction and washed thoroughly with cold water. It was then recrystallized to constant melting point from dilute ethanol. The purity of the compound was checked and characterized by recording its infrared and NMR spectra (Savitha & Gowda, 2006). The single crystals used in X-ray diffraction studies were grown in ethanolic solution by slow evaporation at room temperature.

### S3. Refinement

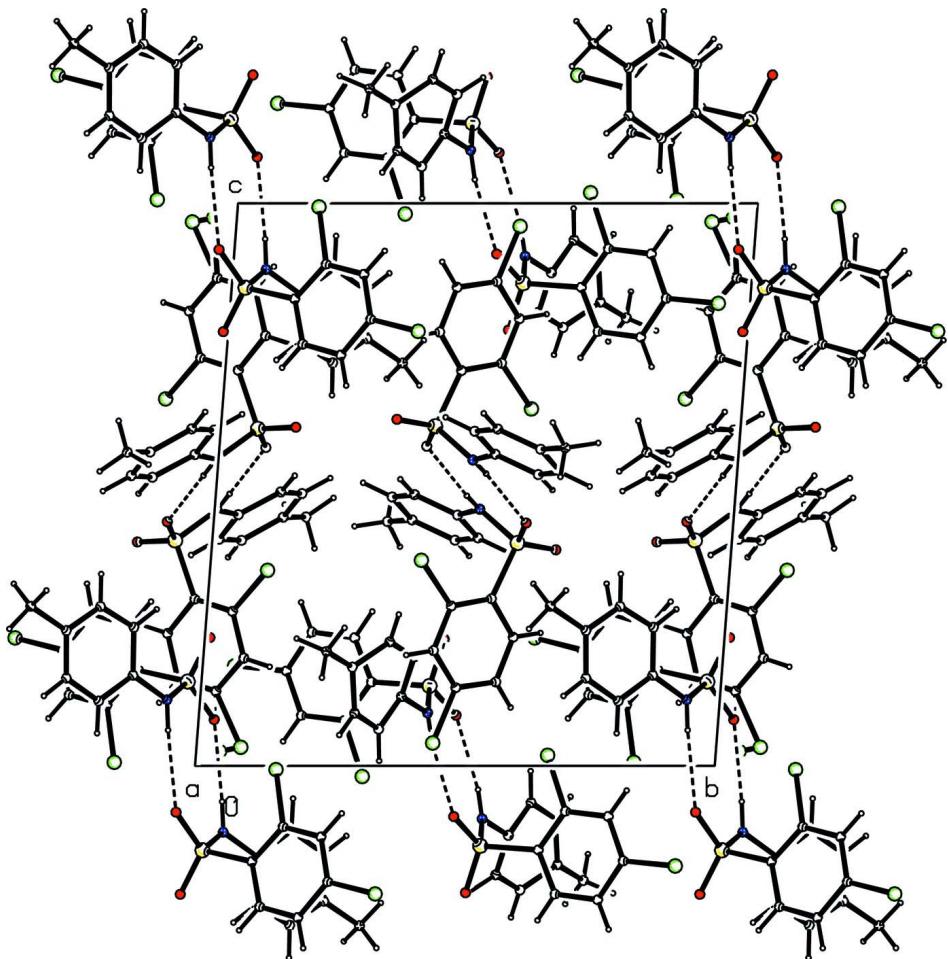

The H atoms of the NH groups were located in a difference map and refined with the distance restraint N—H = 0.86 (3) Å. The other H atoms were positioned with idealized geometry using a riding model [C—H = 0.93–0.96 Å]. All H atoms were refined with isotropic displacement parameters (set to 1.2 times of the  $U_{\text{eq}}$  of the parent atom).

Two of the benzene rings with C21, C22, C24, C25 and C28, C29, C30, C31, C32, respectively, with Cl5 and Cl6 are disordered and were refined using a split model. The corresponding site-occupation factors were fixed to 0.50:0.50, and their corresponding bond distances in the disordered groups were restrained to be equal.

**Figure 1**

Molecular structure of (I), showing the atom labeling and displacement ellipsoids drawn at the 50% probability level. Both disorder components are shown. The disorder components are shown with dashed bonds.

**Figure 2**

Molecular packing of (I) with hydrogen bonding shown as dashed lines. For more clarity the disorder components were omitted.

Extinction correction: *SHELXL97* (Sheldrick,  
2008),  $Fc^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$   
Extinction coefficient: 0.0029 (3)

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
