## 2,2-Dichloro-1-(2-phenyl-1,3-oxazolidin-3-yl)ethanone

Fei Ye, Ying Fu* and Shuang Zhao

College of Science, Northeast Agricultural University, Harbin 150030, People's Republic of China
Correspondence e-mail: fuying@neau.edu.cn

Received 11 January 2010; accepted 19 January 2010

Key indicators: single-crystal X-ray study; $T=298 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.040 ; w R$ factor $=0.110$; data-to-parameter ratio $=19.6$.

In the title molecule, $\mathrm{C}_{11} \mathrm{H}_{11} \mathrm{Cl}_{2} \mathrm{NO}_{2}$, the oxazolidine ring is in an envelope conformation with the O atom forming the flap; the other four essentially planar ring atoms (r.m.s. deviation = $0.012 \AA$ ) form a dihedral angle of 91.1 (3) ${ }^{\circ}$ with the phenyl ring. In the crystal structure, molecules are linked by weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming onedimensional chains.

## S1. Comment

Substituted oxazolidines are important synthetic targets due to their biological activity (Agami et al., 2004), pharmacological activity and their extensive use as chiral auxiliaries for the synthesis of many chiral compounds (Guirado et al., 2003; Tararov et al. 2003). Dichloroacetemide compounds have been shown to act as herbicide safeners (Hatzios, 2004; Daniele et al., 2007). As part of our ongoing investigations of oxazolidine derivatives we prepared the title compound and its crystal structure is reported herein.
The molecular structure of the title compound is shown in Fig.1. In the crystal structure, molecules are linked by weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds to form one-dimensional chains (Fig. 2).

## S2. Experimental

The title compound was prepared by a slightly modified literature procedure (Fu et al., 2009).
Ethanolamine $(4.1 \mathrm{~g}, 0.067 \mathrm{~mol})$ and $7.1 \mathrm{~g}(0.067 \mathrm{~mol})$ of benzaldehyde were mixed with 25 mL of benzene. The reaction mixture was stirred for 1 h at $306-308 \mathrm{~K}$. Then, the mixture was heated to reflux and water was evaporated, followed by cooling to 273 K and 7.5 mL of $33 \%$ sodium hydroxide solution was added. $11.8 \mathrm{~g}(0.08 \mathrm{~mol})$ of dichloroacetyl chloride was added dropwise with stirring, keeping the temperature at $273-277$ K. Stirring was continued for 1.5 h . The mixture was rinsed with water until the $\mathrm{pH}=7$. The organic phase was dried over anhydrous magnesium sulfate and the benzene was removed under vacuum. The crude product was recrystallized with ethyl acetate and light petroleum, white crystals wre obtained. The yield was $58.2 \%$. m.p. $374-377 \mathrm{~K}$.
The single-crystal suitable for X-ray structural analysis was obtained by slow evaporation of a solution of the title compound in petroleum ether and ethyl acetate at room temperature.

## S3. Refinement

All H atoms were initially located in a difference Fourier map. The $\mathrm{C}-\mathrm{H}$ atoms were then constrained to an ideal geometry, with $\mathrm{C}-\mathrm{H}=0.93-0.98 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$.

Figure 1
The molecular structure of the title compound, with the atom-labelling scheme.Displacement ellipsoids are drawn at the $30 \%$ probability level.

Figure 2
Part of the crystal structure of the title compound showing C-H $\cdots \mathrm{O}$ hydrogen bonds as dashed lines.

$R_{\text {int }}=0.022$
$\theta_{\text {max }}=28.3^{\circ}, \theta_{\text {min }}=2.8^{\circ}$
$h=-25 \rightarrow 25$

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.040$
$w R\left(F^{2}\right)=0.110$
$S=1.04$
2846 reflections
145 parameters
0 restraints
Primary atom site location: structure-invariant direct methods
$k=-14 \rightarrow 14$
$l=-15 \rightarrow 15$

Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H -atom parameters constrained
$w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.0473 P)^{2}+1.2513 P\right]$ where $P=\left(F_{\mathrm{o}}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
$(\Delta / \sigma)_{\max }<0.001$
$\Delta \rho_{\text {max }}=0.41 \mathrm{e}_{\AA^{-3}}$
$\Delta \rho_{\text {min }}=-0.29 \mathrm{e}^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
