Received 22 February 2010; accepted 24 February 2010

Key indicators: single-crystal X-ray study; $T = 300\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$;
 R factor = 0.044; wR factor = 0.130; data-to-parameter ratio = 24.5.

In the title compound, $\text{C}_{23}\text{H}_{23}\text{Cl}_2\text{N}_3\text{O}_2$, the pyrrolidine ring adopts an envelope conformation and the piperidinone ring assumes a slightly twisted chair form. In the crystal, inversion dimers linked by pairs of $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds generate an R_2^8 graph-set motif and a short $\text{Cl}\cdots\text{Cl}$ contact of 3.478 (1) \AA occurs.

S1. Comment

Pyrrolo ring compounds are prevalent in a variety of biologically active compounds (Watson *et al.*, 2001) and find utility in the treatment of diseases such as diabetes, cancer and viral infections. Since the biological activity depends on the conformation of rings that constitute a molecule, precise description, at atomic resolution, of the title compound is expected to supplement further studies on structure-activity relationships on these compounds. Also, the effect of halogen- substitutions on the conformation of the molecule and consequently on the packing modes remains an area of immense interest in crystallography (Awwadi *et al.*, 2006).

In the title compound (I), the 5-membered methyl substituted pyrrolidine ring adopts the envelope conformation with C5 deviating from the plane defined by the rest of the atoms of the ring by 0.639 (2) Å. The puckering parameters (Cremer & Pople, 1975) of this ring are $Q = 0.431$ (2) Å and $\varphi = 331.2^\circ$. The piperidinone ring adopts a slightly twisted chair conformation with the N1A and C4A atoms deviating by about 0.712 (2) and -0.523 (2) Å, respectively, from the plane defined by C2A,C3,C5A and C6A with an r.m.s. deviation of 0.041 Å. The chair conformation is also evident from the corresponding puckering amplitudes [$Q=0.561$ (2) Å, $/q = 16.0$ (2)°, $/f = 30.8$ (6)°]. The oxindole and the dichloro substituted phenyl rings are planar.

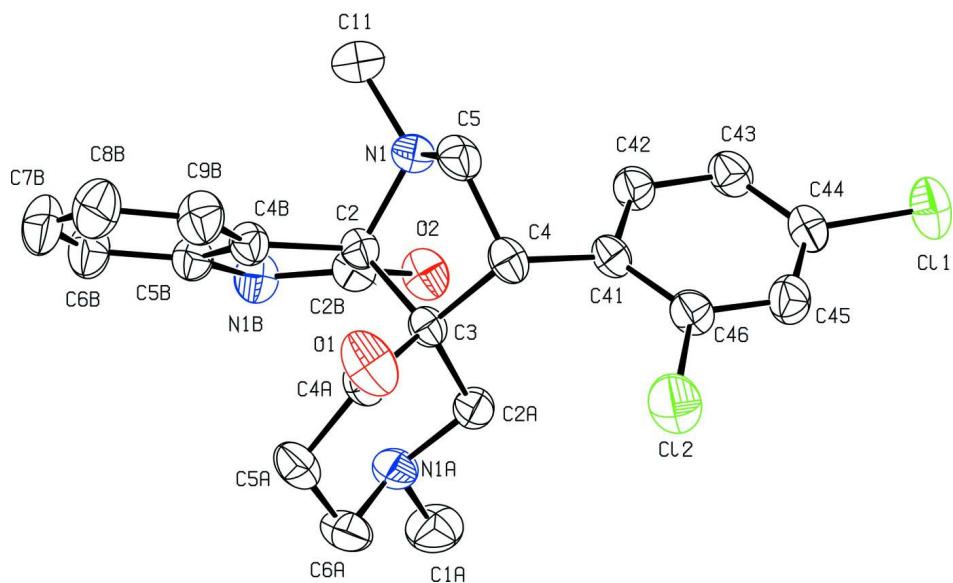

A relatively strong intermolecular [N1B—H1B···O2(-x, -y, 1-z)] hydrogen bond relates centrosymmetric pairs of molecules (Fig. 2). These N—H···O hydrogen bonds form R^{8_2} graph set motifs (Etter *et al.*, 1990) which are interconnected through Cl···Cl interactions [Cl1···Cl2 ($x-1, y, z$) 3.478 (1) Å] leading to columns of molecules parallel to the a-axis (Fig. 3). These columns resemble a 'ladder-like' arrangement of molecules much similar to the one seen in DNA, except for the twist. These columns of molecules have interactions that are van der Waals in nature.

S2. Experimental

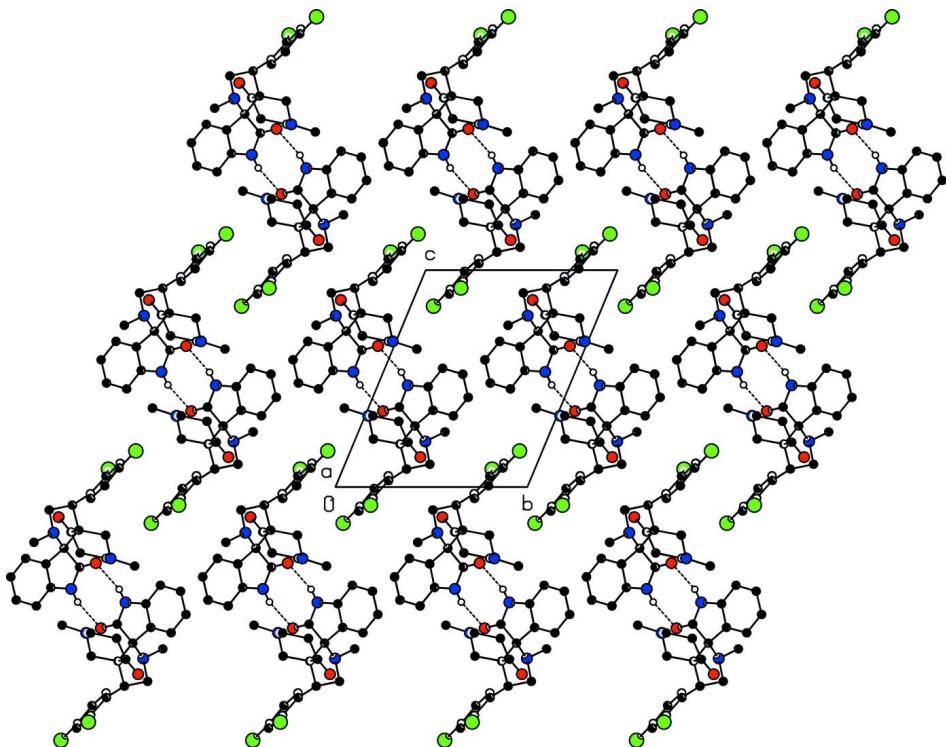

A mixture of 1-methyl-3-[*(E*)-(2,4-dichlorophenyl)methylidene] tetrahydro-4(1*H*)pyridinone (1 mmol), isatin (1 mmol) and sarcosine (1 mmol) were refluxed in methanol (15 ml) for 4 h. After completion of the reaction (TLC), the mixture was poured into water (30 ml) and the precipitate was filtered off and washed with water to obtain the product as white solid (0.28 g, 85%), m.p. 190–191 °C.

S3. Refinement

H atoms were positioned geometrically and refined using a riding model with C—H = 0.95–0.99 Å and with $U_{\text{iso}}(\text{H}) = 1.2$ (1.5 for methyl groups) times $U_{\text{eq}}(\text{C})$.

**Figure 1**

The molecular structure of (I), with atom labels and 50% probability displacement ellipsoids for non-H atoms. H atoms have been omitted for clarity.

**Figure 2**

A view of the molecular aggregation down the *a*-axis. C-bound H atoms have been omitted for clarity.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
