The asymmetric unit of the title compound {systematic name: (3S,8S,9S,10R,13R,14S,17R)-17-[(E,2R,5S)-5-ethyl-6-methyl-hept-3-en-2-yl]-10,13-dimethyl-2,3,4,7,8,9,11,12,14,15,16,17-dodecahydro-1H-cyclopenta[a]phenanthren-3-yl p-toluene-sulfonate}, $C_{36}H_{54}O_3S$, comprises two independent molecules that differ significantly in terms of the relative orientations of the peripheral groups; the conformation about the C=C bond of the side chain is E. In the crystal, molecules associate into linear supramolecular chains aligned along the a axis via C—H⋯O interactions.

S1. Comment

The title compound, (I), a stigmasterol tosylate, has been used as a precursor for the synthesis of cholesterol and other sterols with variable side-chains (Partridge *et al.* 1974; Khripach *et al.* 2002; Foley *et al.* 2010) and for the determination of absolute configuration (Ketuly *et al.* 1997). Herein, (I) has been characterised by crystallography and shown to crystallise with two independent molecules in the crystallographic asymmetric unit, Figs 1 and 2. While the central steroid residues in the independent molecules are virtually superimposable, as seen from Fig. 3, the peripheral groups have quite different orientations. These differences are quantified in the values of the C5–S1–O1–C8 and C38–S2–O4–C41 torsion angles of 67.92 (13) and -63.53 (14) °, respectively, which indicate that the tosylate groups lie to either side of the respective molecule. The differences in the orientation of the terminal *iso*-propyl group are best quantified in the C27–C28–C29–C30, C31 torsion angles of 45.2 (2) and 168.45 (16) °, respectively, compared with 58.2 (2) and -66.8 (2) ° for C60–C61–C62–C63,C64, respectively. The conformation about the C=C [C26=C27 = 1.322 (3) Å and C59=C60 = 1.324 (2) Å] double bond of the side-chain in each molecule is *E*.

In the crystal structure, the molecules associate into linear supramolecular chains aligned along the *a* axis mediated by C–H···O interactions, Fig. 2 and Table 1. The chains inter-digitate along the *b* axis as shown in Fig. 5.

S2. Experimental

Stigmasterol (40 g, 97 mmol) was dissolved in dried and redistilled pyridine (250 ml) and *p*-toluenesulfonyl chloride (30 g, 157.4 mmol) added, and the solution was then stirred at room temperature for 28 h. The reaction mixture was mixed with 5% aqueous sodium bicarbonate and the solid precipitate filtered, washed with water, dried at room temperature, and recovered (52 g). The crude product was recrystallized from acetone, yielding fine crystals of stigmasterol tosylate (45.8 g), m.pt. 407–410 K. The compound was further recrystallised and colourless blocks of (I) were grown from n-hexane:carbon tetrachloride (1/1), m.pt. 415–417 K [Lit. 415–417 K (Foley *et al.* , 2010)].

S3. Refinement

The H atoms were geometrically placed (C–H = 0.95–1.00 Å) and refined as riding with U_{iso}(H) = 1.2–1.5U_{eq}(C).

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
