Received 9 April 2010; accepted 28 April 2010

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.001\text{ \AA}$ ;  $R$  factor = 0.042;  $wR$  factor = 0.125; data-to-parameter ratio = 28.1.

In the title sydnone compound [systematic name: 3-(2,3-dimethyl-5-oxo-1-phenyl-2,5-dihydro-1*H*-pyrazol-4-yl)-1,2,3-oxadiazol-3-iium-5-olate],  $\text{C}_{13}\text{H}_{12}\text{N}_4\text{O}_3$ , the oxadiazole and pyrazole rings are essentially planar [maximum deviations = 0.006 (1) and 0.019 (1)  $\text{\AA}$ , respectively] and are inclined at interplanar angles of 37.84 (4) and 46.60 (4) $^\circ$ , respectively, with respect to the benzene ring. In the crystal, adjacent molecules are interconnected into a three-dimensional supramolecular network *via* intermolecular C–H $\cdots$ O hydrogen bonds. Weak intermolecular  $\pi$ – $\pi$  aromatic stacking interactions [centroid–centroid distance = 3.5251 (5)  $\text{\AA}$ ] further stabilize the crystal packing.

## 3-(2,3-Dimethyl-5-oxo-1-phenyl-2,5-dihydro-1*H*-pyrazol-4-yl)sydnone

Jia Hao Goh, Hoong-Kun Fun, Nithinchandra and B. Kalluraya

### S1. Comment

Sydnones constitute a well-defined class of mesoionic compounds that contain a 1,2,3-oxadiazole ring system. The introduction of the concept of mesoionic structure for certain heterocyclic compounds in the year 1949 has proved to be fruitful development in heterocyclic chemistry (Baker *et al.*, 1949). The study of sydnones still remains a field of interest because of their electronic structure and also because of the various types of biological activities displayed by some of them. Interest in sydnone derivatives has also been encouraged by the discovery that they exhibit various pharmacological activities (Hedge *et al.*, 2008; Rai *et al.*, 2008).

3-aryl sydnones are prepared by the cyclisation of *N*-nitroso-*N*-aryl glycines with acetic anhydride. These *N*-nitroso-*N*-aryl glycines were obtained by the nitrosation of *N*-substituted glycines. The *N*-substituted glycine was obtained by the hydrolysis of corresponding ester with sodiumhydroxide. The ester is in turn obtained by the reaction of appropriately substituted aniline with ethyl aceto acetate in absolute ethanol medium employing anhydrous sodium acetate as the catalyst (Kalluraya *et al.*, 2004; Rai *et al.*, 2008).

In the title sydnone compound (Fig. 1), the 1,2,3-oxadiazole (N3/N4/O1/C10/C11) and pyrazole (N1/N2/C7-C9) rings are essentially planar, with maximum deviations of 0.006 (1) and -0.019 (1) Å, respectively, at atoms N4 and N1. These two rings are inclined at interplanar angles of 37.84 (4) and 46.60 (4)°, respectively, with the C1-C6 benzene ring. As reported previously (Goh *et al.*, 2010a,b), the exocyclic C10—O3 bond length of 1.2205 (9) Å is inconsistent with the formulation of Baker & Ollis (1957), which involves the delocalization of a positive charge in the 1,2,3-oxadiazole ring, and a negative charge in the exocyclic oxygen. The bond lengths (Allen *et al.*, 1987) and angles are within normal range and comparable to those observed in closely related pyrazole (Goh *et al.*, 2009a,b) and sydnone (Goh *et al.*, 2010a,b) structures.

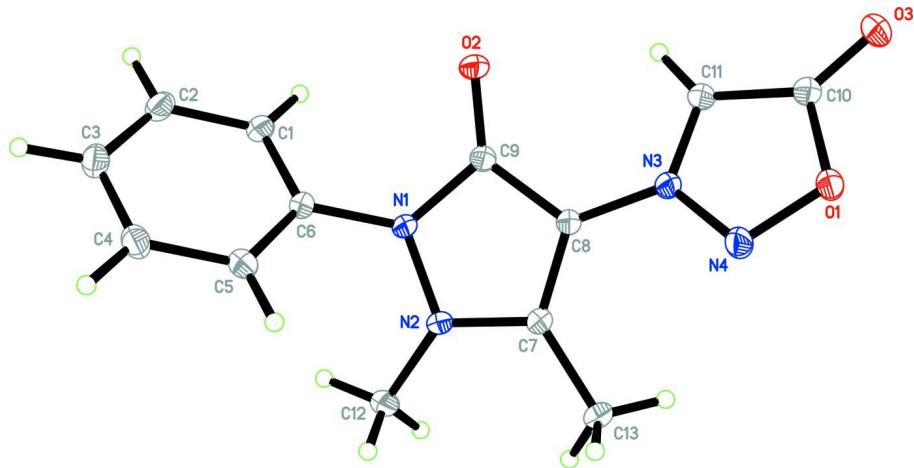

In the crystal packing, C1—H1A···O3, C13—H13A···O3, C11—H11A···O2 and C12—H12B···O2 hydrogen bonds (Table 1) form two different pairs of intermolecular bifurcated acceptor hydrogen bonds, which link the molecules into a three-dimensional supramolecular network. The crystal packing is further stabilized by weak intermolecular  $\pi$ – $\pi$  aromatic stacking interactions [ $Cg1 \cdots Cg2^{ii} = 3.5251 (5)$  Å, (ii) =  $-x+1, y-1/2, -z+1/2$  where  $Cg1$  and  $Cg2$  are centroids of pyrazole and benzene rings, respectively].

### S2. Experimental

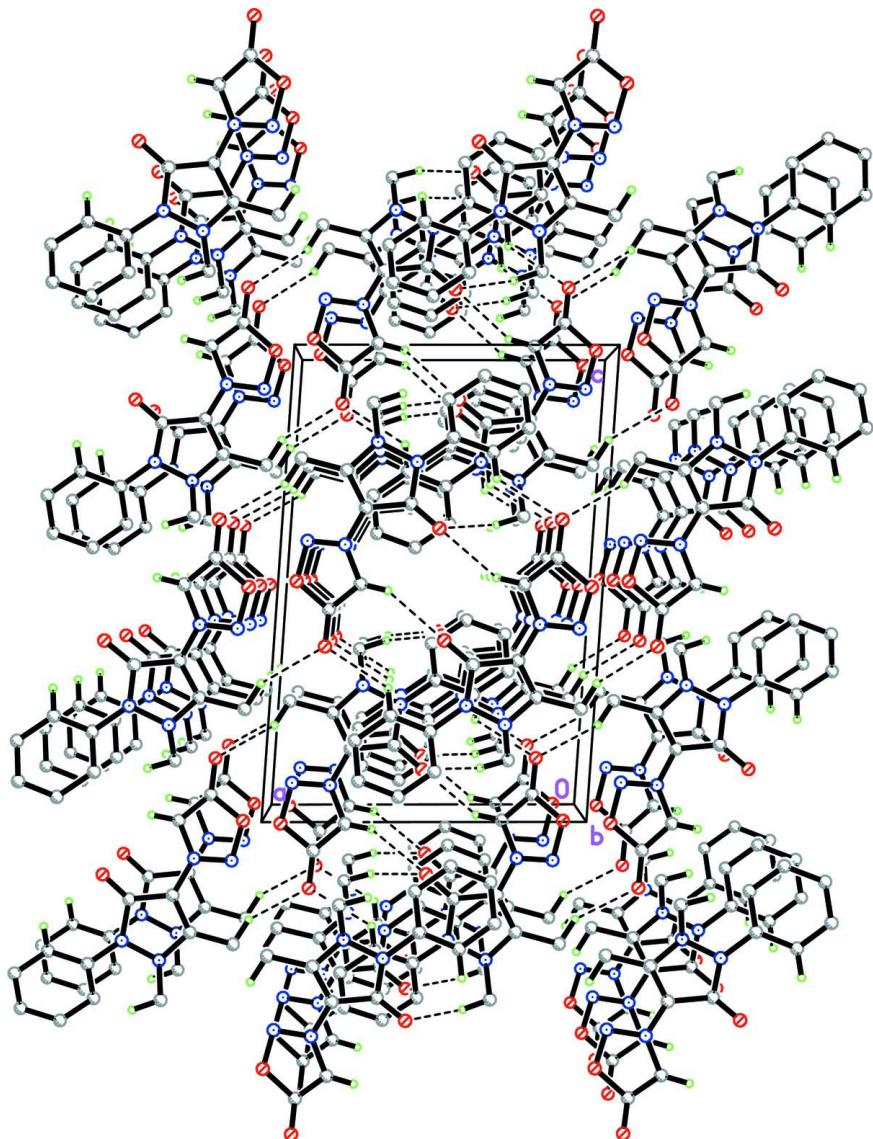

[(1,5-Dimethyl-3-oxo-2-phenyl-2,3-dihydro-1*H*-pyrazol-4-yl)(nitroso) amino]acetic acid (0.1 mol) was heated with acetic anhydride (0.5 mol) on a water bath for 2–4 h, the reaction mixture was kept aside at room temperature for overnight. It was then poured into ice cold water, filtered and washed with water, sodium bicarbonate solution (5 %) and again with water. The solid product was dried and crystallized from benzene. Single crystals suitable for X-ray analysis were obtained from a 1:2 mixture of DMF and ethanol by slow evaporation.

**S3. Refinement**

All hydrogen atoms were located from difference Fourier map [range of C—H = 0.944 (13)–0.993 (16) Å] and allowed to refine freely.

**Figure 1**

The molecular structure of the title compound, showing 50% probability displacement ellipsoids for non-H atoms and the atom-numbering scheme.

**Figure 2**

The crystal packing of the title compound, viewed along the *b* axis, showing a three-dimensional supramolecular network. Hydrogen atoms not involved in intermolecular interactions (dashed lines) have been omitted for clarity.

*Special details*

**Experimental.** The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1)K.

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor  $wR$  and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
