Received 30 April 2010; accepted 10 May 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.004 Å; R factor = 0.054; wR factor = 0.132; data-to-parameter ratio = 17.1.

In the title compound, $[Cr_2Ni(C_{16}H_{14}N_2O_2)_2(CN)_4(C_{10}H_{24}N_4)]\cdot 2CH_3OH$, each $[Cr(salen)(CN)_2]$ unit {salen is 2,2′-[ethane-1,2-diylbis(nitrilomethylidyne)]diphenolate} acts as a monodentate ligand through one of its two cyanide groups N bound to a central $[Ni(cyclam)]^{2+}$ core (cyclam is 1,4,8,11-tetraazacyclotetradecane). Each Cr^{III} ion is coordinated by two N and two O atoms from a salen ligand situated in the equatorial plane with two *trans* cyanide C atoms, yielding a distorted octahedral coordination geometry. The Ni^{II} atom lies on an inversion center and is octahedrally coordinated by a cyclam ligand lying in the equatorial plane and by two cyanide N atoms. The asymmetric unit contains one half of the complex molecule and a methanol solvent molecule. In the crystal structure, the complex molecule is linked to the methanol solvent molecules *via* O—H···O and N—H···O hydrogen bonds. Individual complex molecules are linked by C—H···N hydrogen bonds, forming chains along *b*.

S1. Comment

Cyanide-bridged infinite systems (or Prussian blue analogues) and high-spin clusters have attracted great research interest due to their unique magnetic properties, including high-Tc superconducting magnets and photoinduced magnetization. Among these interesting researches, low-dimensional complexes as well as polynuclear clusters have attracted special attention, because they can be used to investigate the inter-metallic magnetic coupling quantitatively (Lescouëzec *et al.*, 2005).

Recently, a new cyanide-containing building block K[Cr(salen)$(CN)_2$] (salen^{2-} = N,*N*′- bis(salicyl)ethylenediaminate) with two trans cyanide groups has been exploited to assemble cyanide-bridged low-dimensional complexes (Ni *et al.*, 2008). By using this new building block, we report here the synthesis and crystal structure of the title compound, [Cr(salen)$(CN)_2$]$_2$[Ni(cyclam)].CH_3OH.

Complex I consists of a trinuclear cluster and one methanol solvate molecule. As shown in Fig. 1, in this trinuclear cluster, the [Cr(salen)$(CN)_2$] unit acts as a monodentate ligand through one of its two cyanide groups toward a central [Ni(cyclam)]$^{2+}$ core. The nickel atom is in an axially elongated octahedral environment. Four nitrogen atoms from the cyclam ligand form the equatorial plane. Two cyanide nitrogen atoms occupy the axial positions. The complex are linked with the methanol solvate molecules *via* O—H···O and N—H···O hydrogen bonds (Fig. 2). The individual complex molecules are linked by C—H···N hydrogen bonds to form chains along *b*.

S2. Experimental

K[Cr(salen)$(CN)_2$].H_2O was synthesized according to the procedure described in the literature (Yamada *et al.*, 1969). Ni(cyclam)$(ClO_4)_2$ was synthesized as described previously (Bosnich *et al.*, (1965).

A solution of K[Cr(salen)$(CN)_2$].H_2O (79.6 mg, 0.2 mmol) in methanol (5 ml) was added dropwise to a solution of Ni(cyclam)$(ClO_4)_2$ (45.5 mg, 0.1 mmol) in water (3 ml). The mixture was stirred at room temperature for 5 min s and then filtered. Orange block crystals of (I) suitable for X-ray analysis were obtained by slow evaporation of the filtrate.

S3. Refinement

Aromatic H atoms were placed in calculated positions with C—H = 0.93 Å, and refined in riding mode with U_{iso}(H) = 1.2U_{eq}(C).

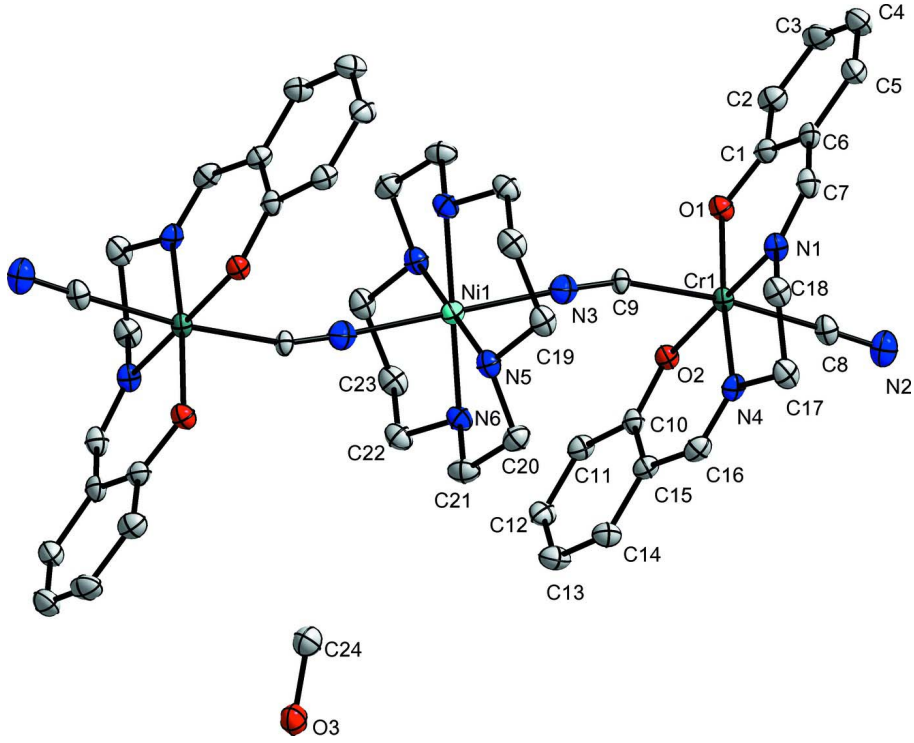

Figure 1

The molecular structure of (I), shown with 50% probability displacement ellipsoids.The unlabeled atoms are derived from the reference atoms by means of the (2-x, -y, 2-z) symmetry transformation.

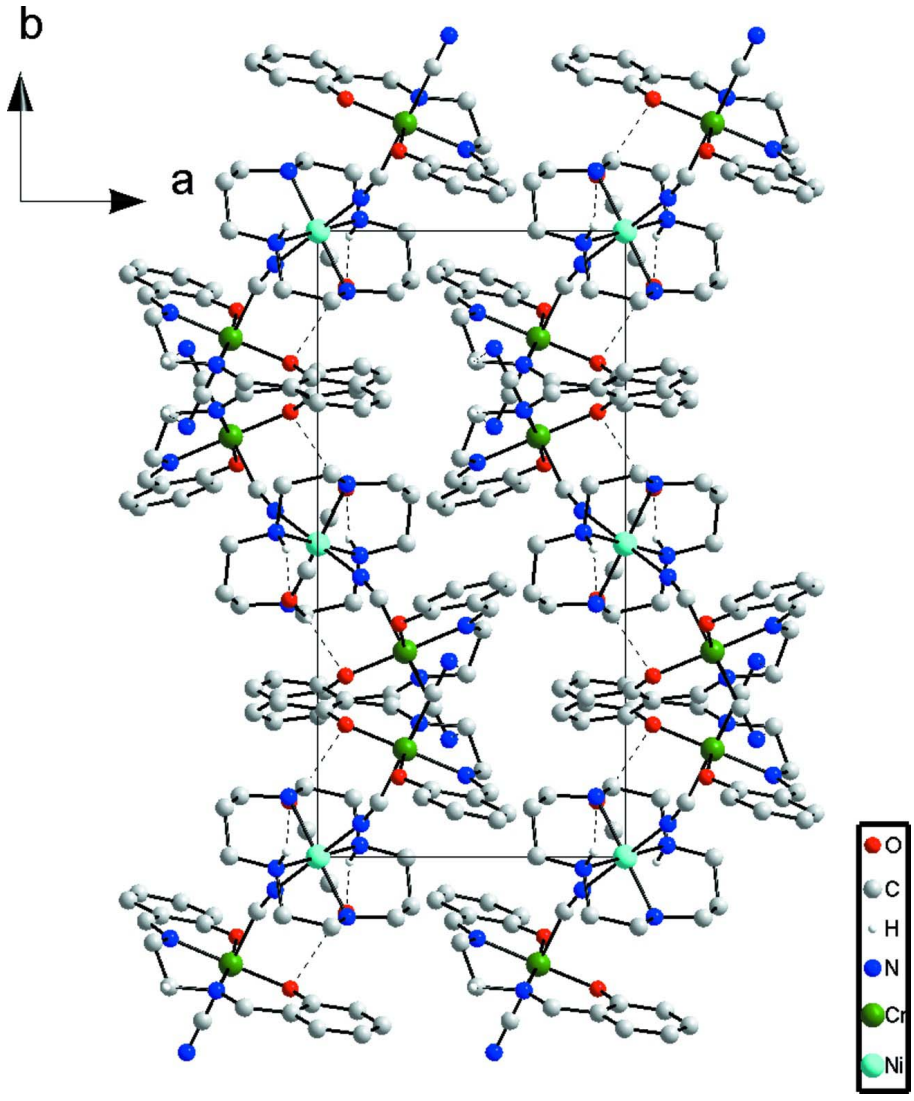

Figure 2

Packing diagram viewed down the *c* axis, The O—H···O and N—H···O hydrogen bonds are shown as dotted lines.

$(\Delta/\sigma)_{max}$ = 0.001
$\Delta\rho_{max}$ = 0.76 e Å^{-3}
$\Delta\rho_{min}$ = −0.76 e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
