## 2,3,6,7-Tetrakis(bromomethyl)naphthalene

Maciej Skibiński, ${ }^{\text {a }}$ Vladimir A. Azov ${ }^{\text {a }}$ and Peter G. Jones ${ }^{\text {b }}$ *<br>${ }^{\text {a }}$ Department of Chemistry, University of Bremen, Leobener Strasse NW 2C, 28359 Bremen, Germany, and ${ }^{\mathbf{b}}$ Institute of Inorganic and Analytical Chemistry, Technical University of Braunschweig, Postfach 3329, 38023 Braunschweig, Germany Correspondence e-mail: p.jones@tu-bs.de

Received 3 June 2010; accepted 22 June 2010
Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.016 ; w R$ factor $=0.034 ;$ data-to-parameter ratio $=25.9$.

The title compound, $\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{Br}_{4}$, crystallizes with imposed inversion symmetry. In the crystal, the molecules pack in layers parallel to $(10 \overline{1})$. The layers involve two $\mathrm{Br} \cdots \mathrm{Br}$ and one $\mathrm{H} \cdots \mathrm{Br}$ contact. Between the layers, one contact each of types $\mathrm{Br} \cdots \mathrm{Br}, \mathrm{H} \cdots \mathrm{Br}$ and $\mathrm{Br} \cdots \pi$ is observed.

## 2,3,6,7-Tetrakis(bromomethyl)naphthalene

Maciej Skibiński, Vladimir A. Azov and Peter G. Jones

## S1. Comment

The title compound is a symmetric rigid molecule with four bromomethyl groups. The bromine atoms can be easily substituted by other nucleophiles, which offers the opportunity of employing the compound as a building block for construction of various functional architectures. The title compound was prepared to serve as a spacer between two tetrathiafulvalene (TTF) groups in TTF-containing molecular tweezers (Skibiński et al., 2009). It was first employed as an intermediate in the preparation of triple-layered [2.2]naphthalenophane (Otsubo et al., 1983), and several other triplelayered cyclophanes (Otsubo et al., 1983; Yano et al., 1999). It was also used as an intermediate in the synthesis of Hbonded molecular capsules (Valdes et al., 1995; Rivera et al., 2001).
The molecule of the title compound is shown in Fig. 1. It displays crystallographic inversion symmetry (operator \#1-x, $1-y, 1-z$ ); for this reason, the crystallographic numbering does not correspond to the IUPAC numbering scheme. Bond lengths and angles may be considered normal; the bromine atoms are directed to opposite sides of the ring system, with $\mathrm{C}(2)-\mathrm{C}(3)-\mathrm{C}(6)-\mathrm{Br}(1) 92.22(16), \mathrm{C}(3)-\mathrm{C}(4)-\mathrm{C}(7)-\mathrm{Br} 2-79.86(17)^{\circ}$, which leads to a $+/ /-/+$ pattern of Br atoms about the ring plane for the IUPAC-numbered $\mathrm{C} 2,3,6,7$; this contrasts with the $-/ /+/+$ pattern in 1,2,4,5-tetrakis(bromomethyl)benzene (Jones \& Kuś, 2007), which is also inversion-symmetric.
Details of the packing interactions are given in the Tables. The molecules pack in layers parallel to ( $10 \overline{1}$ ). Within the layers, the contacts $\mathrm{Br} 1 \cdots \mathrm{Br} 2$, the longer $\mathrm{Br} 2 \cdots \mathrm{Br} 2$ and the shorter $\mathrm{H} 6 \mathrm{~A} \cdots \mathrm{Br} 2$ are observed. These combine to form columns of interactions parallel to the $b$ axis; chains of molecules parallel to [101] (horizontal in Fig. 2) are also formed. The contacts $\mathrm{Br} 2 \cdots \mathrm{Br} 2$ (the shorter), $\mathrm{H} 6 \mathrm{~A} \cdots \mathrm{Br} 2$ (the longer) and $\mathrm{Br} 1 \cdots C g(C g=$ centre of gravity of the ring $\mathrm{C} 1-5$ and $\mathrm{C} 1 \# 1$ ) link the layers (Fig. 3). H5 $\cdots \operatorname{Br} 13.11 \AA$ between the layers is a borderline interaction. The $\mathrm{Br} \cdots C g$ interaction could alternatively be interpreted as $\mathrm{Br} \cdots \mathrm{C} 5$, which at 3.450 (2) $\AA$ is by far the shortest of the six $\mathrm{Br} \cdots \mathrm{C}$ contacts; it is often unclear which is the better interpretation in such systems (Jones \& Kuś, 2010). Despite the presence of the naphthalene ring systems, there are no significant $C g \cdots C g$ interactions. The shortest $\mathrm{H} \cdots C g$ contact is $\mathrm{H} 7 \mathrm{~A} \cdots C g(1-x, 1-$ $y,-z) 3.10 \AA$ between layers, but this is both long and has a narrow angle $\left(124^{\circ}\right)$. We can conclude that the crystal packing of the title compound is dominated by the contacts involving bromomethylene groups.

## S2. Experimental

The title compound was prepared as described by Rivera et al. (2001) by treatment of a solution of 2,3-bis[\{[(1,1-dimethylethyl)dimethylsilyl]oxy\} methyl]- 6,7-bis[(phenylmethoxy)methyl]-naphthalene in chloroform with gaseous HBr . The compound was obtained as a colourless microcrystalline solid. Yield: 87\%. Crystals suitable for X-ray diffraction were grown by slow evaporation of a solution in $\mathrm{EtOH} / \mathrm{hexane} / \mathrm{CH}_{2} \mathrm{Cl}_{2}$. M.p. (decomp.) $230-231^{\circ} \mathrm{C}$ (lit. $230^{\circ} \mathrm{C}$ ). ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$ ): $\delta=7.83(\mathrm{~s}, 4 \mathrm{H}), 4.84(\mathrm{~s}, 8 \mathrm{H})$ p.p.m..

The title compound is poorly soluble $(<1 \mathrm{~g} / L)$ in most organic solvents at room temperature, but is much more soluble in aromatic solvents, such as toluene or chlorobenzene, upon reflux.

## S3. Refinement

Hydrogen atoms were included at calculated positions using a riding model with aromatic $\mathrm{C}-\mathrm{H} 0.95$, methylene $\mathrm{C}-\mathrm{H}$ $0.99 \AA$. The $U(\mathrm{H})$ values were fixed at $1.2 \times U_{\mathrm{eq}}(\mathrm{C})$ of the parent C atom.

Figure 1
Structure of the title compound in the crystal. Ellipsoids represent $50 \%$ probability levels. Only the asymmetric unit is numbered.

Figure 2
Molecular packing of the title compound as a layer parallel to $(10 \overline{1}) . \mathrm{Br} \cdots \mathrm{Br}$ and $\mathrm{H} \cdots \mathrm{Br}$ contacts are shown as thick dashed bonds.

## Figure 3

Linking between the layers of the title compound. $\mathrm{Br} \cdots \mathrm{Br}$ and $\mathrm{H} \cdots \mathrm{Br}$ contacts are shown as thick dashed bonds. One representative $\mathrm{Br} \cdots C g$ contact is shown as a thin dashed bond (top left).

$\Delta \rho_{\text {min }}=-0.49 \mathrm{e}^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
