The asymmetric unit of the title compound, $C_{16}H_{17}ClNO_2S^+$·HSO_4^-, (I) [systematic name: (+)-(S)-5-[(2-chlorophenyl)-(methoxycarbonyl)methyl]-4,5,6,7-tetrahydrothieno[3,2-c]-pyridin-5-ium hydrogen sulfate], contains two independent cations of clopidogrel and two independent hydrogensulfate anions. The two independent cations are of similar conformation; however, this differs from that observed in orthorhombic form (II) [Bousquet *et al.* (2003). US Patent No. 6 504 030]. The H—N—C_{chiral}—H fragment shows a *trans* conformation in both independent cations in (I) and a *gauche* conformation in (II). In (I), classical intermolecular N—H···O and O—H···O hydrogen bonds link two independent cations and two independent anions into an isolated cluster, in which two cations interact with one anion only *via* N—H···O hydrogen bonds. Weak intermolecular C—H···O hydrogen bonds further consolidate the crystal packing.

Related literature

For the characterization of six polymorphic forms of Clopidogrel hydrogensulfate, see: Badorc & Frehel (1989) (form I); Bousquet *et al.* (2003) (orthorhombic form II); Lifshitz-Liron *et al.* (2006) (forms III-VI). For recent studies of forms I and II, see: Raijada *et al.* (2010); Zupancic *et al.* (2010); Srivastava *et al.* (2010); Song *et al.* (2010). For details of the indexing algorithm, see: Werner *et al.* (1985). The methodology of the refinement (including applied restraints and constraints) was described in detail by Chernyshev *et al.* (2009).

Monoclinic form I of clopidogrel hydrogen sulfate from powder diffraction data

Vladimir V. Chernyshev, Sergey V. Pirogov, Irina N. Shishkina and Yurii A. Velikodny

S1. Comment

Clopidogrel hydrogensulfate is an antiplatelet drug, which acts by selective and irreversible inhibition of ADP-induced platelet aggregation. The drug is available in the market as oral solid dosage form. Six different polymorphs are known for the drug - **I** (Badorc & Frehel, 1989), **II** (Bousquet *et al.*, 2003) and **III-VI** (Lifshitz-Liron *et al.*, 2006). However, only polymorphs **I** and **II** are used in pharmaceutical formulations (Bousquet *et al.*, 2003), and, therefore, they are under intensive studies (Raijada *et al.*, 2010; Zupanˇciˇc *et al.*, 2010; Srivastava *et al.*, 2010; Song *et al.*, 2010). The crystal structure of orthorhombic polymorph **II** has been reported by Bousquet *et al.* (2003). Herewith we report the crystal structure of the monoclinic polymorph **I**.

The asymmetric unit of **I** (Fig. 1), contains two independent cations of clopidogrel and two independent hydrogensulfate anions. The two independent cations are of similar conformation, which, however, differs from that observed in **II**. The H–N—C_{chiral}–H fragment shows a *trans* conformation in both independent cations in **I** and a *gauche* conformation in **II**.

The hydrogen-bonding motifs in **I** and **II** are essentially different too. In **I**, the classical intermolecular N—H···O and O—H···O hydrogen bonds (Table 1) link two independent cations and two independent anions into isolated cluster, where two cations interact with one anion only *via* N—H···O hydrogen bonds (Fig. 1). Weak intermolecular C—H···O hydrogen bonds (Table 1) consolidate further the crystal packing of **I**. In **II**, O—H···O hydrogen bonds link anions into linear chains, while N—H···O hydrogen bond attach one cation to one anion. These differences in crystal packings of Forms **I** and **II** may explain why **II** exhibits a lower solubility (and is more stable) than **I**.

S2. Experimental

The title compound I was synthesized in accordance with the known procedure (Badorc & Frehel, 1989), and obtained as a white polycrystalline powder. Optical rotation $[\alpha]_D$ +53.8° (c<$\imath$> 1.9, CH_3OH).

S3. Refinement

During the exposure, the specimen was spun in its plane to improve particle statistics. The monoclinic unit-cell dimensions were determined with the indexing program TREOR (Werner *et al.*, 1985), M_{20}=37, using the first 30 peak positions. The same monoclinic unit-cell dimensions were reported in 2003 by Martin Vickers at http://img.chem.ucl.ac.uk/www/reports/clopi/clopi.htm.

The structure of was solved by simulated annealing procedure (Zhukov *et al.*, 2001) and refined following the methodology described in (Chernyshev *et al.*, 2009). For non-H atoms, ten independent U_{iso} parameters were refined - six for six independent Cl and S atoms, two common U_{iso} for two groups of anion′ oxygen atoms, and two common U_{iso} for the rest atoms in independent cations. H atoms were placed in geometrically calculated positions and not refined. The diffraction profiles and the differences between the measured and calculated profiles are shown in Fig. 2.
Figure 1
The content of asymmetric unit of **I** showing the atomic labeling and 40% probability displacement spheres. Dashed lines denote classical N—H⋯O and O—H⋯O hydrogen bonds.
Figure 2
The Rietveld plot, showing the observed and difference profiles for **I**. The reflection positions are shown above the difference profile.

Preferred orientation correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
