Received 28 July 2010; accepted 29 July 2010

 Key indicators: single-crystal X-ray study;  $T = 150$  K; mean  $\sigma(\text{C}-\text{C}) = 0.002$  Å;  $R$  factor = 0.025;  $wR$  factor = 0.070; data-to-parameter ratio = 32.9.

 The title compound,  $\text{C}_2\text{H}_8\text{NO}_3\text{P}$ , crystallizes in its zwitterionic form  $\text{H}_3\text{N}^+\text{CH}(\text{CH}_3)\text{PO}(\text{O}^-)(\text{OH})$ . In the crystal, the molecules are linked by  $\text{N}-\text{H}\cdots\text{O}$  and  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds.

## Related literature

**S1. Comment**

The title compound, *R*-1-aminoethylphosphonic acid (C<sub>2</sub>H<sub>8</sub>NO<sub>3</sub>P), is the phosphonic analogue of the amino acid alanine and, therefore, it is commonly represented as *L*-Ala-P (Au *et al.*, 2008). It presents antibacterial activity (Allen *et al.*, 1979) and it has been employed as inhibitor in the crystallization of the enzyme alanine racemase from *Bacillus anthracis* (Au *et al.*, 2008). Remarkably, only two coordination compounds containing *L*-Ala-P as ligand are known, namely a racemic coordination polymer of zinc (Cui *et al.*, 2006) and a chiral molybdenum cluster (Carraro *et al.*, 2008). Following our interest in the use of phosphonic acid molecules in the construction of multi-dimensional coordination polymers (Cunha-Silva, Ananias *et al.*, 2009; Cunha-Silva, Lima *et al.*, 2009; Shi, Cunha-Silva *et al.*, 2008; Shi, Trindade *et al.*, 2008), herein we wish to describe the crystal structure of the title compound.

The title compound crystallises in its zwitterionic form in which the acidic phosphonate moiety donates one proton to the amino group (Fig. 1). Individual molecular units are disposed in a zigzag fashion along the [100] direction of the unit cell, leading to the formation of a supramolecular chain held together by a combination of the inner ...O1...H1—N1<sup>+</sup>—H3... hydrogen bonds [graph set motif C<sup>1</sup><sub>2</sub>(4), Grell *et al.* (1999) - green dashed bonds in Fig. 2], and the outer isolated O2—H4...O3 interactions (violet dashed bonds in Fig. 2). Supramolecular chains are in turn interconnected in the *bc* plane *via* the remnant N1<sup>+</sup>—H2...O2 hydrogen bonds as depicted in Fig. 3 (orange dashed lines). It is noteworthy that all hydrogen bonding interactions are rather strong and directional: while the internuclear D...A distances range from 2.5484 (10) to 2.8369 (12) Å, the <(DHA) are all greater than 157°. As depicted in Fig. 3, the crystal packing promotes a close proximity between the substituent —CH<sub>3</sub> groups which point toward each other.

**S2. Experimental**

The title compound was purchased from Sigma-Aldrich (>97.0%, Fluka) and was used as received without purification. Suitable single crystals were grown from an aqueous solution over a period of two weeks.

<sup>1</sup>H-NMR (300.13 MHz, D<sub>2</sub>O) δ: 1.27 (dd, 3H, *J*(<sup>1</sup>H-<sup>1</sup>H) = 7.3 Hz and *J*(<sup>1</sup>H-<sup>31</sup>P) = 14.8 Hz, CH<sub>3</sub>) and 3.19 (dq, 1H, *J*(<sup>1</sup>H-<sup>1</sup>H) = 7.3 Hz and *J*(<sup>1</sup>H-<sup>31</sup>P) = 12.7 Hz, CH).

<sup>13</sup>C-NMR (75.47 MHz, D<sub>2</sub>O) δ: 16.4 (d, *J*(<sup>13</sup>C-<sup>31</sup>P) = 2.6 Hz, CH<sub>3</sub>) and 47.6 (d, *J*(<sup>13</sup>C-<sup>31</sup>P) = 145.1 Hz, CH).

<sup>31</sup>P-NMR (121.49 MHz, D<sub>2</sub>O) δ: 14.8 (dq, *J*(<sup>31</sup>P-<sup>1</sup>H) = 13.8 and 14.6 Hz).

**S3. Refinement**

Hydrogen atoms bound to carbon were located at their idealized positions and were included in the final model in the riding-motion approximation with C—H = 1.00 Å (tertiary C—H) or 0.98 Å (—CH<sub>3</sub>). The isotropic thermal displacement parameters for these atoms were fixed at 1.2 (for methine-H) or 1.5 (methyl-H) times *U*<sub>eq</sub> of the respective parent atom.

Hydrogen atoms associated with the protonated  $\text{—NH}_3^+$  group or the pendant  $\text{—OH}$  moiety were located from difference Fourier maps and were included in the final model with the distances restrained to  $0.95(1) \text{ \AA}$  and  $U_{\text{iso}}=1.5 \times U_{\text{eq}}$  of the respective parent atom. The  $\text{H}\cdots\text{H}$  distances of the  $\text{—NH}_3^+$  terminal group were further restrained to  $1.55(1) \text{ \AA}$  in order to ensure a chemically reasonable geometry for this moiety.

**Figure 1**

Molecular structure of the title compound. Displacement ellipsoids are drawn at the 80% probability level and the atomic labeling is provided for all non-hydrogen atoms.

**Figure 2**

Supramolecular one-dimensional zigzag chain running parallel to the [100] direction of the unit cell. The inner N—H···O interactions composing the graph set motif  $C_2^1(4)$  are represented as dashed green lines, while the outer O—H···O bonds as violet dashed green lines. For hydrogen bonding geometrical details see Table 1. Symmetry operations used to generate equivalent atoms have been omitted for simplicity.

Figure 3

Crystal packing of the title compound viewed in perspective along the [100] direction of the unit cell. Hydrogen bonds are represented as dashed green (intra-chain N—H...O type), violet (O—H...O) or orange (inter-chain N—H...O interactions) lines.

Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
