Received 5 September 2010; accepted 19 September 2010

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; R factor = 0.051; wR factor = 0.165; data-to-parameter ratio = 13.7.

In the title compound, $\text{C}_{17}\text{H}_{18}\text{N}_4\text{O}_3\cdot\text{C}_3\text{H}_7\text{NO}$, the main disubstituted urea and solvate molecules are linked by pairs of $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds. In the main molecules, the benzene rings form a dihedral angle of $15.59(13)^\circ$ and two intramolecular $\text{O}-\text{H}\cdots\text{N}$ hydrogen bonds influence the molecular conformation. In the crystal structure, weak intermolecular $\text{C}-\text{H}\cdots\text{O}$ interactions link the hydrogen-bonded pairs into chains along the b axis. The chains associate via $\text{C}-\text{H}\cdots\pi$ interactions.

1,5-Bis[1-(2-hydroxyphenyl)ethylidene]carbonohydrazide dimethylformamide monosolvate

Lingyun Du and Wenkang Zhang

S1. Comment

Carbonohydrazide derivatives exhibit various bioactivities such as antibacteriale antifungal, anticonvulsant and anticancer activities (Loncle *et al.*, 2004; Li *et al.*, 2004). Herewith we present the crystal structure of the title compound (I), which is a new carbonohydrazide derivative.

Crystals of (I) comprise equal quantities of a disubstituted urea molecule (M) and a solvent N,N-dimethylformamide molecule (Fig. 1). The bond lengths and angles of the title compound are normal and correspond to those observed in *N,N'*-bis (1-(2-hydroxyphenyl)ethylidene)carbonohydrazide dimethyl sulfoxide solvate (Zukerman-Schpector *et al.*, 2009). The molecular conformation of M is influenced by two intramolecular O—H···N hydrogen bonds (Table 1). Two benzene rings - C4-C9 and C12-C17, respectively - form a dihedral angle of 15.59 (13)°.

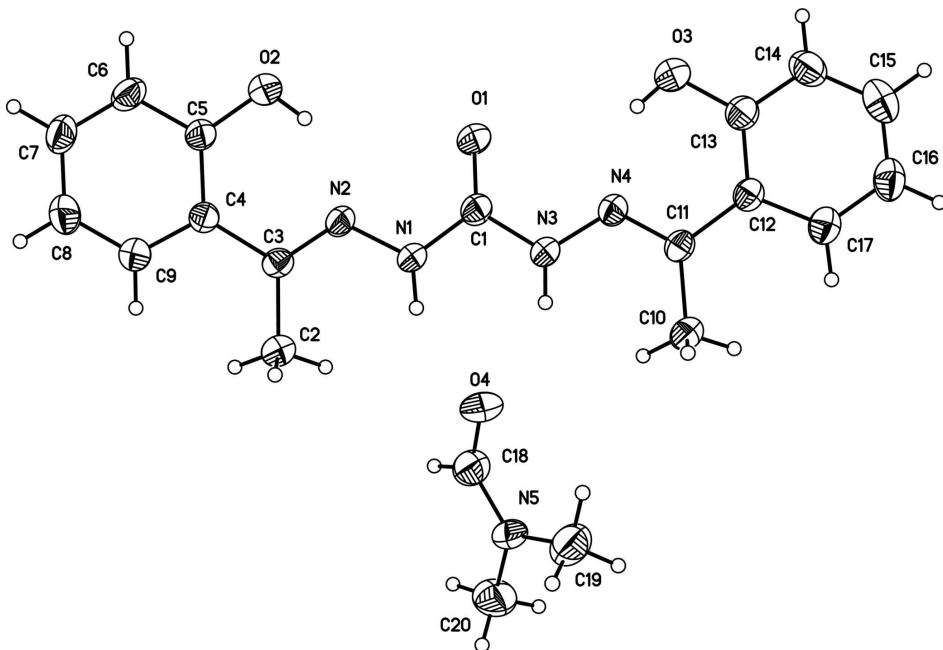

In the crystal structure, one M molecule and solvate molecule are paired *via* N—H···O hydrogen bonds (Table 1). Weak intermolecular C—H···O interactions (Table 1) link hydrogen-bonded pairs into chains along the *b* axis. The chains associate *via* C—H···π interactions (Table 1).

S2. Experimental

2-Hydroxylacetophenone (10.0 mmol) and carbohydrazide (5.0 mmol) were mixed in 50 ml flash After stirring 3 h at 373 K, the resulting mixture was cooled to room temperature, and recrystallized from DMF, and afforded the title compound as a crystalline solid. Elemental analysis: calculated for C₂₀H₂₅N₅O₄: C 60.14, H 6.31, N 17.53%; found: C 60.23, H 6.45, N 17.64%.

S3. Refinement

All H atoms were placed in geometrically idealized positions (N—H 0.86 and C—H = 0.93–0.96 Å, O—H= 0.82 Å) and treated as riding on their parent atoms, with $U_{\text{iso}}(\text{H}) = 1.2\text{--}1.5 U_{\text{eq}}$ of the parent atom.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg is the centroid of the C12—C17 ring.

D—H···A	D—H	H···A	D···A	D—H···A
N1—H1···O4	0.86	2.02	2.805 (3)	151
