Received 8 September 2010; accepted 14 September 2010

Key indicators: single-crystal X-ray study; $T = 173$ K; mean $\sigma(\text{C}-\text{C}) = 0.006$ Å; R factor = 0.057; wR factor = 0.109; data-to-parameter ratio = 13.7.

The title compound, $[\text{Ni}(\text{C}_{11}\text{H}_{10}\text{N}_2\text{O}_2)_2](\text{C}_7\text{H}_5\text{O}_2)_2$, consists of an Ni^{II} ion coordinated by two tridentate chelating (2-py)₂-C(OH)₂ ligands (py is pyridyl) and two benzoate anions. The Ni^{II} ion is located on a twofold rotation axis, and its geometry is distorted octahedral. The *gem*-diol ligand (2-py)₂C(OH)₂ adopts an $\eta^1:\eta^1:\eta^1$ coordination mode. There are O—H...O hydrogen bonds between the *gem*-diol ligands and benzoate anions.

Bis(di-2-pyridylmethanediol- κ^3N,O,N')nickel(II) dibenzoate**Jin Hoon Kim, Du-Hyun Kim, Pan-Gi Kim, Cheal Kim and Youngmee Kim****S1. Comment**

The interaction of transition metal ions with biologically active molecules such as amino acids, proteins, sugars, fulvic acids and humic acids is of great importance in the biological systems (Daniele, *et al.*, 2008; Parkin, 2004; Tshuva and Lippard, 2004). As models to examine the interaction, the study on the interaction of the transition metal ions with various acids such as benzoic acid has been intensively examined. Our group have also reported a variety of structures of copper(II) and zinc(II) benzoates with quinoxaline, 6-methylquinoline, 3-methylquinoline, *trans*-1-(2-pyridyl)-2-(4-pyridyl)ethylene, and di-2-pyridyl ketone (Lee, *et al.*, 2008; Yu, *et al.*, 2008; Park, *et al.*, 2008; Shin, *et al.*, 2009; Yu, *et al.*, 2009*a,b*; Yu, *et al.*, 2010).

Di-2-pyridyl ketone ((py)₂CO) has been employed to form structurally interesting new complexes with 3 d-metal ions (Stoumpos, *et al.*, 2009). While the neutral ligands (py)₂C(OH)₂ and (py)₂C(OR)(OH) coordinate to the metal centres as N,N',O chelates (Papaefstathiou and Perlepes, 2002), water and alcohols (ROH) have been shown to add to the carbonyl group forming the ligands (2-py)₂C(OH)₂ [the *gem*-diol form of (2-py)₂CO] and (2-py)₂C(OR)(OH) [the hemiacetal form of (2-py)₂CO], respectively (Efthymiou *et al.*, 2006). The Ni(II) complexes of the neutral ligand, (py)₂C(OH)₂ have been characterized (Wang, *et al.*, 1986; Li, *et al.*, 2005; Yu, *et al.*, 2009*a,b*), but no structure with a benzoate ion as the counterion has been reported. We report here another structure of Ni^{II} benzoate containing a neutral ligand (2-py)₂C(OH)₂.

The Ni^{II} atom is coordinated by two tridentate chelating (2-py)₂C(OH)₂ ligand to form a distorted octahedral geometry. The Ni^{II} ion is located on a two fold axis. The *gem*-diol ligand (2-py)₂C(OH)₂ adopts the coordination mode $\eta^1:\eta^1:\eta^1$ (Fig.1). There are hydrogen bonds between the *gem*-diol hydrogen atoms and benzoate oxygen atoms.

S2. Experimental

36.4 mg (0.125 mmol) of Ni(NO₃)₂·6H₂O and 35.5 mg (0.25 mmol) of C₆H₅COONH₄ were dissolved in 4 ml water and carefully layered by 4 ml solution of a mixture of acetone, methanol and ethanol (1/1/1) of di-2-pyridyl ketone ligand (46.1 mg, 0.25 mmol). Suitable crystals of the title compound for X-ray analysis were obtained in a month.

S3. Refinement

H atoms were placed in calculated positions and treated as riding on their parent atoms with C—H distances of 0.93 Å (phenyl) and 0.84 Å (hydroxyl) and U_{iso}(H) = 1.2U_{eq}(C) or 1.5U_{eq}(O).

**Figure 1**

Structure of the title complex with labeling scheme. Displacement ellipsoids are shown at the 50% probability level. H atoms are represented as small sphere of arbitrary radii and hydrogen bonds are shown as dashed line [Symmetry code: (i) $-x+1, y, -z+3/2$]

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
