Received 20 October 2010; accepted 23 October 2010

 Key indicators: single-crystal X-ray study; $T = 297$ K; mean $\sigma(\text{C}-\text{C}) = 0.010$ Å; R factor = 0.045; wR factor = 0.141; data-to-parameter ratio = 14.7.

The title molecule, $\text{C}_9\text{H}_5\text{Br}_2\text{N}$, is almost planar, with an r.m.s. deviation of 0.027 Å. The dihedral angle between the aromatic rings is 1.5 (3)°. In the crystal, π - π stacking interactions are present between the pyridine and benzene rings of adjacent molecules [centroid-centroid distances = 3.634 (4) Å], and short Br...Br contacts [3.4443 (13) Å] occur.

6,8-Dibromoquinoline

İsmail Çelik, Mehmet Akkurt, Osman Çakmak, Salih Ökten and Santiago García-Granda

S1. Comment

The quinoline skeleton is often used for designing of many synthetic compounds with diverse pharmacological and medicinal properties. Quinolines and their derivatives have shown to display a wide spectrum of biological activities such as antibacterial (Metwally *et al.*, 2006), antimycobacterial (Vinsova *et al.*, 2008; Vangapandu *et al.*, 2004), antineoplastic (Zhao *et al.*, 2005; Sissi & Palumbo, 2003; Musiol *et al.*, 2007; Zhu *et al.*, 2007), antiparasitical (Muscia *et al.*, 2006; Blackie *et al.*, 2007; Gómez *et al.*, 2008; Gómez-Barrio *et al.*, 2006; Kouznetsov *et al.*, 2005, 2007), and anti-inflammatory behavior (Chen *et al.*, 2006; Abadi *et al.*, 2005; Ökten *et al.*, 2010). Quinoline also constitutes a key structural component of numerous compounds with pharmacological activity, dyestuffs, materials with metal-halogen exchange, and agrochemical (Lindley, 1984) and couplings (Vladimir *et al.*, 2005). Bromoquinolines have been of interest for chemists as precursors for heterocyclic compounds due to important scaffolds in medicinal chemistry. It was developed a convenient synthetic methodology for 6,8-disubstituted quinoline derivatives and the values of 6,8-dibromoquinoline as precursors to the corresponding disubstituted quinolines were presented. New disubstituted quinoline derivatives were synthesized *via* substitution reaction by using 6,8-DiBrQ, converted to further substituted quinoline. That may serve for the synthesis of natural bioactive quinolines derivatives because there are many biological active 6 and 8-functionalized quinolines such as quinine, pentaquine, and plasmoquine (Şahin *et al.*, 2008).

The molecular structure of the title compound (I) is shown in Fig. 1 with their respective labels. Bond lengths and angles in (I) are within normal ranges. In this structure, the quinoline motif (N1/C1–C9) is essentially planar with maximum deviations of 0.029 (7) Å for C3 and 0.031 (9) Å for C8. The Br1—C2—C3—C4 and Br2—C4—C5—C6 torsion angles are -179.0 (5) and 178.7 (5)°, respectively.

The crystal structure of (I) is stabilized by π – π stacking interactions, along the *a* axis, between N1/C1/C6–C9 (centroid Cg1) and C1–C6 (centroid Cg2) rings, with a Cg1...Cg2 distance of 3.634 (4) Å, (Fig. 2).

S2. Experimental

6,8-DiBromo-1,2,3,4-tetrahydroquinoline was synthesized in proper literature (Ökten *et al.*, 2010). Then, DDQ (2 g, 6.88 mmol) was dissolved in freshly distilled and dried benzene (10 ml) under an argon atmosphere. To a solution of 6,8-diBrTHQ (1 g, 3.44 mmol) in benzene (30 ml) was added the solution of DDQ. The mixture was refluxed at 353 K for 36 h. Upon cooling, the dark green solidified mixture was filtered and the solvent was removed in vacuo. The residue was filtered from a short silica column (1/9, EtOAc/hexane, $R_f = 0.4$). Recrystallization of the product from hexane–chloroform gave 6,8-diBrQ in a yield of 88% (868 mg) as colourless plates, m.p. 372–373 K. ^1H NMR (CDCl_3 , 400 MHz) δ 9.04 (dd, $J_{23} = 4.2$ Hz, $J_{24} = 1.6$ Hz, 1H, H₂), 8.16 (d, $J_{57} = 2.4$ Hz, 1H, H₇), 8.09 (dd, $J_{43} = 8.3$ Hz, $J_{24} = 1.6$ Hz, 1H, H₄), 7.96 (d, $J_{57} = 2.4$ Hz, 1H, H₅), 7.49 (dd, $J_{32} = 4.2$ Hz, $J_{34} = 8.3$ Hz, 1H, H₃); ^{13}C NMR (100 MHz, CDCl_3) δ 151.5, 144.1135.9, 135.7, 130.1, 129.7, 125.9, 122.7, 119.9; IR (KBr, cm^{-1}) ν_{max} 3026, 1638, 1617, 1587, 1545, 1467, 1443, 1347, 1306, 1183, 1084, 1030, 962, 857, 809, 779, 677, 593, 543, 501. GC–MS m/z 289 (5, M^+), 288 (50), 287 (10), 286 (98), 285

(10), 284 (42), 207 (30), 205 (31), 129 (5), 127 (10), 126 (100), 125 (14), 103 (15), 102 (14), 99 (37), 98 (33), 97 (20), 75 (19), 74 (22), 73 (42), 50 (18), 49 (52), 48 (14), 37 (7), 36 (7). Anal. Calcd for $C_9H_5NBr_2$ (286.95): C 37.67, H 1.76%. Found: C 37.78, H 1.82%.

S3. Refinement

H atoms were included in geometric positions with $C-H = 0.93 \text{ \AA}$ and refined by using a riding model [$U_{iso}(H) = 1.2U_{eq}(C)$].

Figure 1

ω scans	$\theta_{\max} = 70.5^\circ$, $\theta_{\min} = 5.8^\circ$
Absorption correction: part of the refinement model (ΔF) [XABS2 (Parkin <i>et al.</i> , 1995); cubic fit to $\sin(\theta)/\lambda$ - 24 parameters]	$h = -8 \rightarrow 8$ $k = 0 \rightarrow 11$ $l = 0 \rightarrow 15$

Refinement

Refinement on F^2 Least-squares matrix: full $R[F^2 > 2\sigma(F^2)] = 0.045$ $wR(F^2) = 0.141$ $S = 1.02$ 1598 reflections 109 parameters 0 restraints	Secondary atom site location: difference Fourier map Hydrogen site location: inferred from neighbouring sites H-atom parameters constrained $w = 1/[\sigma^2(F_o^2) + (0.0642P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$ $(\Delta/\sigma)_{\max} < 0.001$ $\Delta\rho_{\max} = 0.68 \text{ e } \text{\AA}^{-3}$ $\Delta\rho_{\min} = -0.56 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted R -factors wR and all goodnesses of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating $-R$ -factor-obs *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
