Received 17 December 2010; accepted 21 January 2011

Key indicators: single-crystal X-ray study; $T = 90$ K; mean $\sigma(C-C) = 0.003$ Å; H-atom completeness 85%; disorder in solvent or counterion; R factor = 0.021; wR factor = 0.056; data-to-parameter ratio = 19.6.

The title compound, $(C_4H_{12}N_2)[Ce_2(C_4H_4O_4S)_4(H_2O)_2] \cdot 3H_2O$, features a polymeric anion with a centrosymmetric Ce_2O_2 core and a $Ce \cdots Ce$ distance of 4.3625 (4) Å. The anions form ribbons $\{[Ce_2(C_4H_4O_4S)_4(H_2O)_2]^{2-}\}_n$ extending along [100]. The doubly protonated piperazinium cations reside on centers of inversion and link the polymeric ribbons via N—H···O hydrogen bonding. Each Ce^{III} cation is ten-coordinated by an O_2S donor set from two tridentate sulfanediylacetate (tda) ligands, one water molecule and three other tda O donors from adjacent $\{Ce(tda)_2(H_2O)\}$ units in a distorted bicapped cubic environment. Additional O—H···O hydrogen bonding involving the coordinated and solvent water molecules is also present. H atoms of the crystal water molecules could not be located and were not included in the refinement.

Poly[[piperazine-1,4-dium [diaquatetrakis(μ -sulfanediylacetato)dicerate(III)] trihydrate]

Mohammad Ghadermazi, Marilyn M. Olmstead, Shahideh Rostami and Jafar Attar Ghamaleki

S1. Comment

Thiodiacetic acid is one class of dicarboxylic acid ligands that has been used for construction of coordination polymers. It is a versatile complexing agent with one sulfur and two oxygen donor atoms and can strongly complex metal ions. Although the structural study of sulfanediylacetate-transition metal compounds was initiated several decades ago (Delaunay, *et al.*, 1976), interest in the structural aspects of sulfanediylacetate compounds has remarkably increased in recent years, and many structures with *d*- and *f*-block metals are known to date. The ligand is usually tridentate, but at least one Mn(II) complex has been reported in which it is solely bidentate where the thioether S atom is not involved in bonding to the metal (Marek *et al.*, 2003). The ligand can be simply chelating or is involved in both bridging and chelating modes to give rise to dinuclear complexes (Baggio *et al.*, 1999).

The crystal structure of $\{(C_4H_{12}N_2)[Ce(C_4H_4O_4S)_2(H_2O)]_2\cdot 3H_2O\}_n$ or $\{[(\text{pipzH}_2)[Ce(\text{tda})_2(H_2O)]_2\cdot 3H_2O\}_n$, where tda = $[S(CH_2COO)_2]^{2-}$, sulfanediylacetate, and pipzH₂ is doubly protonated piperazine, is composed of a polymeric dinuclear anion $[Ce(\text{tda})_2(H_2O)]_2^{2-}$, $[\text{pipzH}_2]^{2+}$ cations, and three water molecules of hydration. The components of the structure are shown in Fig. 1. The sulfanediylacetate group involving S1 behaves as both a tridentate chelating ligand and a bridging ligand to form a centrosymmetric dimer. The $Ce_1 \cdots Ce_1^i$ ($i = 1 - x, 1 - y, -z$) distance is 4.3625 (4) Å. The sulfanediylacetate ligand involving S2 is also a tridentate chelating ligand while its oxygen, O8, coordinates to the Ce of an adjoining dimer and propagates the structure as a coordination polymer parallel to [100] (Fig. 2). The more distant Ce_1^{iii} ($iii = 1 + x, y, z$) is 6.4361 (7) Å away from Ce1. The local coordination of the Ce^{III} cations consists of two thioethers (S1 and S2) and four O atoms (O1, O4, O5 and O7) from two chelating sulfanediylacetate groups, three oxygen atoms (O3, O4 and O8) of the carboxylate moieties from other sulfanediylacetate groups, and one oxygen atom from the coordinated water molecule (O9), resulting in an S_2O_8 distorted bicapped cubic environment. The Ce—O and Ce—S distances are normal and are gathered in Table 1. Bond valence sum calculations (Zhang *et al.*, 2004) yield a value of 2.9, in agreement with the oxidation state +III for the cerium atom. The $[\text{pipzH}_2]^{2+}$ cations and water molecules are further engaged in hydrogen bonding between polymeric units (Table 2). Although the H atoms of the uncoordinated water molecules could not be located, O···O contacts between 2.58 and 2.86 Å suggest that these molecules also participate in O—H···O hydrogen bonding.

S2. Experimental

The title compound was prepared by mixing two solutions containing 1.5 g (10 mmol) of 2,2'-thiodiacetic acid in 10 ml THF and 0.86 g (10 mmol) piperazine in 10 ml THF. A white precipitate was obtained after evaporating the solvent. An aqueous solution containing 0.34 g (1.5 mmol) of the obtained ion pair in 20 ml water was added dropwise to 0.21 g (0.5 mmol) $Ce(NO_3)_3 \cdot 6H_2O$ in 15 ml water. After 60 min stirring and heating to 303 K, the solution became clear. Yellow crystals of the title compound were obtained after allowing the mixture to stand for 3 weeks at room temperature to

evaporate the solvent.

S3. Refinement

The C-bound and N-bound hydrogen atoms were placed at calculated positions ($C-H$ 0.99 Å, $N-H$ 0.92 Å) and were treated as riding on their parent atoms with $U(H)$ set to 1.2 $U_{eq}(C)$. The hydrogen atoms bonded to the coordinated water were located in a difference Fourier map and were refined with distance restraints of $O-H$ 0.83 (2) Å and $H\cdots H$ 1.34 (4) Å and their isotropic displacement parameters allowed to refine. There are two sites for water molecules of hydration. One of the hydrate molecules is disordered with respect to a center of symmetry and was kept at 0.5 occupancy and refined with an isotropic displacement parameter. Hydrogen atoms bonded to the water molecules of crystallisation could not be reliably located and were eventually omitted from the refinement. The highest peak in the final difference map is 0.83 Å from Ce1 and the largest hole is 0.87 Å from the same atom.

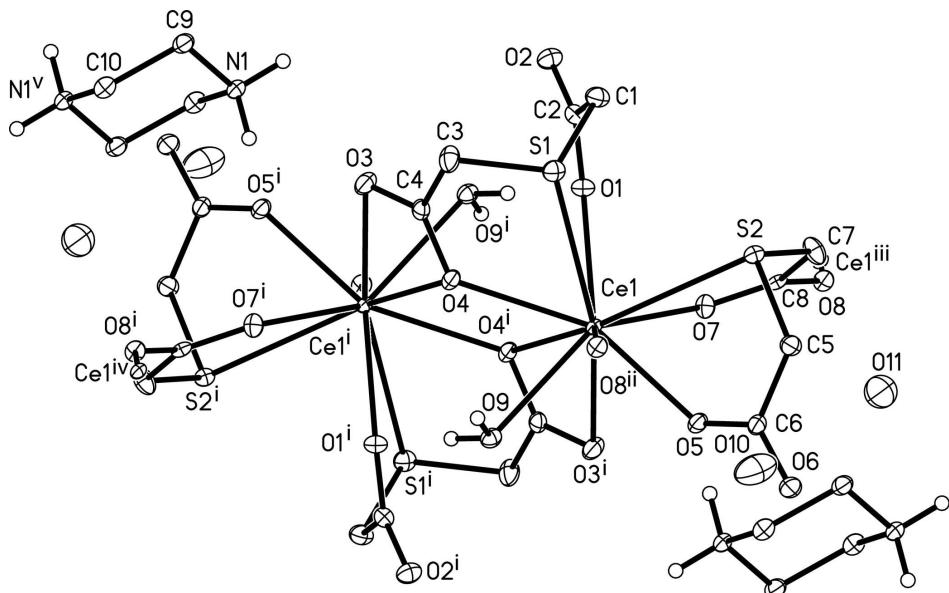

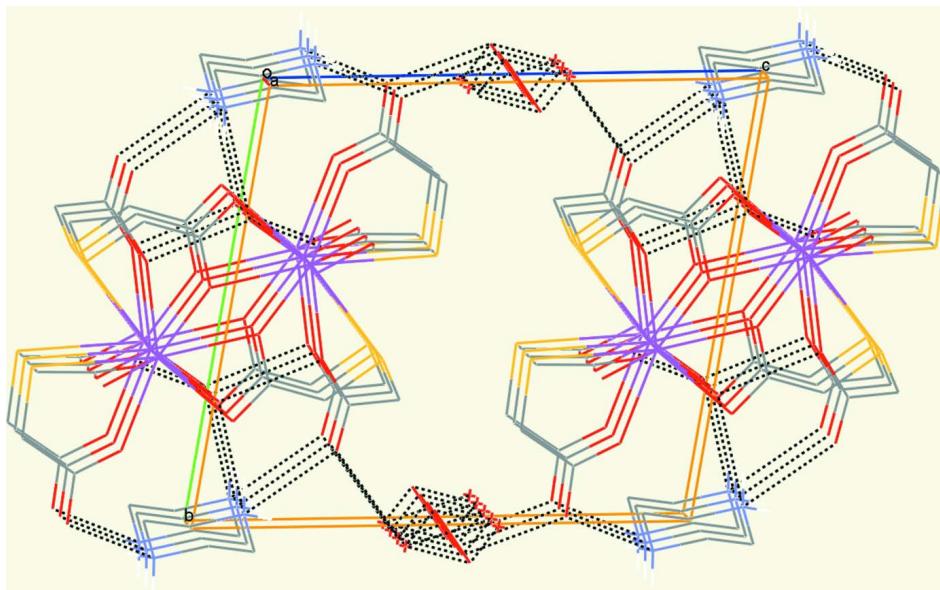

Figure 1

Thermal ellipsoid plot of the title compound at the 50% probability level. Hydrogen atoms are removed for clarity except those bonded to the piperazine N atoms and the coordinated water molecule. Hydrogen atoms are drawn as spheres of arbitrary radius. Atoms that indicate the propagation of the coordination polymer are shown. Symmetry codes: i = 1 - x, 1 - y, -z; ii = x - 1, y, z; iii = 1 + x, y, z; iv = -x, 1 - y, -z; v = -x, 2 - y, -z.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
