Received 18 February 2011; accepted 24 February 2011

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.001\text{ \AA}$; R factor = 0.042; wR factor = 0.125; data-to-parameter ratio = 23.1.

In the title compound, $\text{C}_{10}\text{H}_5\text{FO}_3$, the chromenone ring is essentially planar, with a maximum deviation of $0.039(1)\text{ \AA}$. The dihedral angle between the fluoro-substituted benzene ring and the pyran ring is $1.92(4)^\circ$. In the crystal, molecules are connected via weak intermolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds, forming supramolecular ribbons along the b axis. These ribbons are stacked down the a axis.

7-Fluoro-4-oxochromene-3-carbaldehyde

Mohammad Asad, Chuan-Wei Oo, Hasnah Osman, Madhukar Hemamalini and Hoong-Kun Fun

S1. Comment

A large number of chromones and their derivatives possess a broad range of biological activities such as anti-HIV (Masami *et al.*, 2007), antiallergic (Ellis *et al.*, 1978), anticancer (Raj *et al.*, 2010), antibacterial (Nawrot-Modranka *et al.*, 2006), antiviral and antioxidant (Gomes *et al.*, 2010) properties. We report here the structure of a newly synthesized chromone derivative, 7-fluoro-3-formylchromone. It was synthesized by own experimental process and structure elucidation was primarily carried out by elemental analysis, ^1H NMR and IR spectroscopic techniques.

The asymmetric unit of the title compound is shown in Fig. 1. The chromenone (O1/C1–C9) ring is essentially planar, with a maximum deviation of 0.039 (1) Å for atom C8. The dihedral angle between the fluoro-substituted benzene (C2–C7) ring and the pyran (O1/C1/C2/C7–C9) ring is 1.92 (4) $^\circ$.

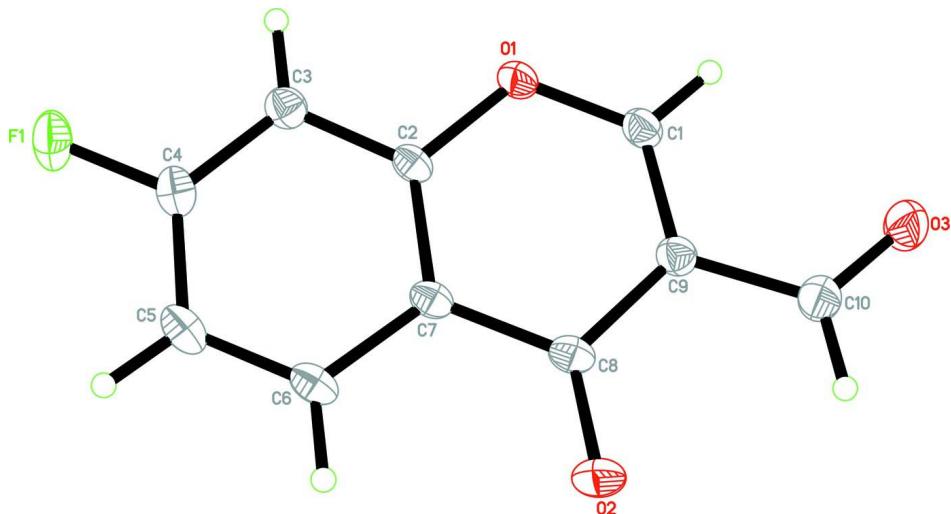

In the crystal structure (Fig. 2), adjacent molecules are connected via intermolecular C1—H1A \cdots O3; C3—H3A \cdots O2 and C10—H10A \cdots O3 (Table 1) hydrogen bonds to form supramolecular ribbons along the *b* axis. These ribbons are stacked down the *a* axis.

S2. Experimental

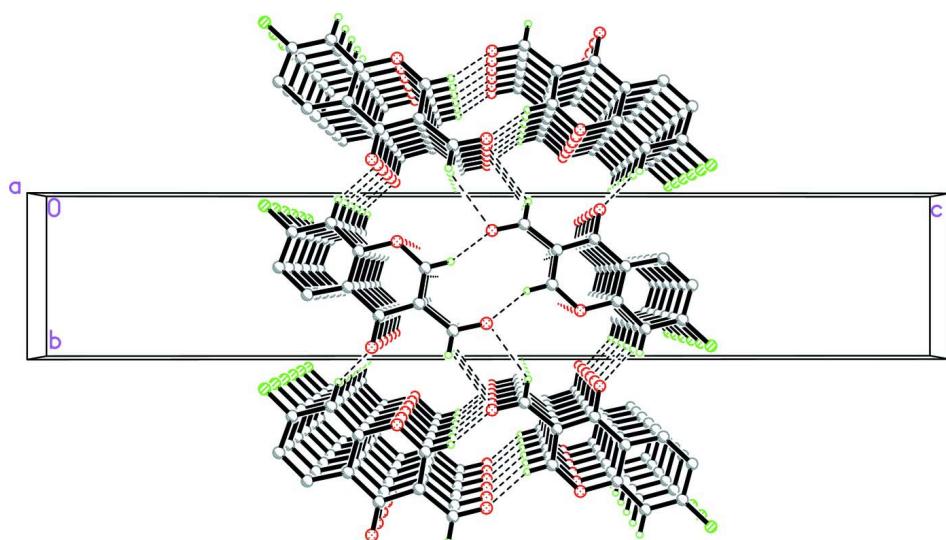

To a well stirred solution of 4-fluoro-2-hydroxyacetophenone (6.5 mmol, 1.0 g) in DMF (4 ml), POCl_3 (26.1 mmol, 2.4 ml) was added dropwise with stirring in ice bath. After 15 minutes, the ice bath was removed and the reaction mixture was continued to be stirred at room temperature for overnight. The resultant reaction mixture was then decomposed by crushed ice and the final product was collected by filtration, washed with ethanol-water and recrystallized from acetone to afford the title compound in 75% yield.

S3. Refinement

All the H atoms were positioned geometrically [C–H = 0.93 Å] and were refined using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$. The highest peak in the final difference map was found at a distance of 0.68 Å from C3 and the deepest hole was 0.79 Å from C2.

**Figure 1**

The asymmetric unit of the title compound, showing 50% probability displacement ellipsoids and the atom-numbering scheme.

**Figure 2**

Crystal packing of the title compound viewed along the a axis, showing a hydrogen-bonded (dashed lines) network.

Hydrogen site location: inferred from
neighbouring sites
H-atom parameters constrained
 $w = 1/[\sigma^2(F_o^2) + (0.0705P)^2 + 0.3007P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} = 0.001$
 $\Delta\rho_{\max} = 0.68 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.18 \text{ e } \text{\AA}^{-3}$

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
