Received 9 August 2011; accepted 20 August 2011

Key indicators: single-crystal X-ray study;  $T = 295$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å; disorder in main residue;  $R$  factor = 0.059;  $wR$  factor = 0.184; data-to-parameter ratio = 17.0.

In the title compound,  $\text{C}_5\text{H}_8\text{N}_3\text{O}^+\cdot\text{ClO}_4^-\cdot\text{C}_5\text{H}_7\text{N}_3\text{O}\cdot\text{H}_2\text{O}$ , each perchlorate anion is paired with a protonated cationic 2-amino-6-methylpyrimidin-4(1*H*)-one and another non-protonated entity of the same organic pyrimidinone. The crystal structure is stabilized by  $\text{N}-\text{H}\cdots\text{O}_{\text{org}}$ ,  $\text{N}-\text{H}\cdots\text{O}_{\text{water}}$ ,  $\text{N}-\text{H}\cdots\text{O}_{\text{ClO}_4}$ ,  $\text{O}-\text{H}\cdots\text{O}_{\text{ClO}_4}$ ,  $\text{N}-\text{H}\cdots\text{N}$  and  $\text{C}-\text{H}\cdots\text{O}_{\text{ClO}_4}$  hydrogen bonds between the anions, organic entities and water molecules. Intermolecular  $\pi-\pi$  stacking interactions between neighbouring organic rings are observed with a face-to-face distance of 3.776 (2) Å, and  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds link the perchlorate anions and the water molecules into chains along the  $b$ -axis direction. The perchlorate anion and the interstitial water molecule are disordered over two mutually incompatible positions with a common occupancy ratio of 0.678 (16):0.322 (16).

## 2-Amino-4-methyl-6-oxo-3,6-dihydropyrimidin-1-ium perchlorate–2-amino-6-methylpyrimidin-4(1*H*)-one–water (1/1/1)

Kamel Kaabi, Maher El Glaoui, Valeria Ferretti, Matthias Zeller and Cherif Ben Nasr

### S1. Comment

Perchlorate salts containing organic cations have been studied extensively in recent years owing to some of their interesting properties such as *e.g.* ferroelectric and dielectric behaviour (Czarnecki *et al.*, 1994; Czupinski *et al.*, 2002; Czupinski *et al.*, 2006). Here, we report the synthesis and the crystal structure of one such compound,  $(\text{C}_5\text{H}_8\text{N}_3\text{O})(\text{C}_5\text{H}_7\text{N}_3\text{O})\text{ClO}_4\cdot\text{H}_2\text{O}$ .

The crystal structure of the title compound (Fig. 1) contains one perchlorate anion, one water molecule, and two 2-amino-6-methylpyrimidin-4(1*H*)-one molecules. One of these molecules is protonated at the nitrogen atom of the six membered ring, thus formally changing the molecule into a 2-amino-4-methyl-6-oxo-3,6-dihydropyrimidin-1-ium cation. The atomic arrangement of  $(\text{C}_5\text{H}_8\text{N}_3\text{O})(\text{C}_5\text{H}_7\text{N}_3\text{O})\text{ClO}_4\cdot\text{H}_2\text{O}$  can be divided into an organic and an inorganic part. The inorganic section is composed of chains of  $[\text{ClO}_4]^-$  tetrahedra and water molecules that extend along the *b* axis direction, held together by  $\text{O}_{\text{water}}-\text{H}\cdots\text{O}(\text{ClO}_4)$  hydrogen bonds. Two such chains cross the unit cell at  $z = (2n + 1)/4$  and  $x = 0.5$  (Fig. 2, Table 1). The organic groups are located between these chains and connect to them through  $\text{N}-\text{H}\cdots\text{O}_{\text{waters}}$ ,  $\text{N}-\text{H}\cdots\text{O}(\text{ClO}_4)$  and  $\text{C}-\text{H}\cdots\text{O}(\text{ClO}_4)$  hydrogen bonds to form a three dimensional infinite network (Fig. 3, Table 1). Of the hydrogen bonds, one is bifurcated:  $\text{O1WA}-\text{H2WA}\cdots(\text{O2}, \text{O4})$  (Fig. 2, Table 1). The organic entities are associated with each other *via*  $\text{N}-\text{H}\cdots\text{O}_{\text{org}}$  and  $\text{N}-\text{H}\cdots\text{N}$  hydrogen bonds (Fig. 3, Table 1). Intermolecular  $\pi-\pi$  stacking interactions between neighbouring organic rings are observed with a face-to-face distance of 3.776 (2) Å, less than 3.8 Å, the maximum regarded as relevant for  $\pi-\pi$  interactions (Janiak, 2000).

The C—N bond distances of the  $\text{NH}_2$  groups, N3—C1 and N6—C6, are 1.311 (2) and 1.327 (2) Å, respectively, which is short for a C—N single bond, but still not quite as contracted as one would expect for a fully established C=N double bond. These bond length features are consistent with an imino resonance form as it is commonly found for C—N single bonds involving  $sp^2$  hybridized C and N atoms (Oueslati *et al.*, 2007). The distance values of C2—O5 [1.233 (2) Å] and C7—O6 [1.260 (2) Å] clearly indicate two C=O double bonds. This confirms that the first step of the formation of the title compound consists in the tautomerization of the starting material 2-amino-4-hydroxy-6-methylpyrimidine into 2-amino-6-methylpyrimidin-4(1*H*)-one.

### S2. Experimental

An aqueous solution of  $\text{Cu}(\text{ClO}_4)_2$  (1 mmol, 0.263 g) was added dropwise to a solution of 2-amino-4-hydroxy-6-methylpyrimidine (1 mmol, 0.125 g) in ethanol. The resultant mixture was evaporated at room temperature. Crystals of the title compound, which remained stable under normal conditions of temperature and humidity, were isolated after several days and subjected to X-ray diffraction analysis (yield 56%).

### S3. Refinement

Reflections (1 1 0), (1 0 0), (-1 0 2), (0 0 2), (0 1 1), (-1 1 1) and (-1 1 2) were obscured by the beamstop and were omitted from the refinement. The oxygen atoms of the perchlorate ion were refined as disordered over two mutually exclusive sets of positions with a refined occupancy ratio of 0.678 (16) to 0.322 (16) for the two orientations. Associated with the perchlorate disorder is disorder of a water molecule, which is distributed over two positions in the same ratio as the anions. All Cl—O bond distances and O···O distances within each disordered moiety were restrained to be each the same within a standard deviation of 0.02 Å. C—H and N—H hydrogen atoms were placed in calculated positions with C—H distances of 0.93 and 0.96 Å and N—H distances of 0.86 Å. The the water hydrogen atom positions were refined with O—H distance restraints of 0.82 (2) Å and H···H distance restraints within each water molecule of 1.35 (2) Å.  $U_{\text{iso}}(\text{H})$  values of all H atoms were constrained to 1.2 (amine, C—H) or 1.5 (CH<sub>3</sub>, O—H) times  $U_{\text{eq}}$  of the respective parent atom.

**Figure 1**

A view of the title compound, showing 50% probability displacement ellipsoids, arbitrary spheres for the H atoms, and the atom numbering scheme.

**Figure 2**

Packing of the title compound viewed down the *b* axis, showing the hydrogen bonding scheme between the water molecules, perchlorate anions and organic entities. Disorder of perchlorate anions and of water molecules is omitted for clarity.

**Figure 3**

Crystal packing arrangement showing the hydrogen bonding scheme between the organic entities. Hydrogen bonds are denoted by dotted lines. Disorder of perchlorate anions and of water molecules is omitted for clarity.

 Extinction coefficient: 0.033 (6)

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
