## Ethyl 5-hydroxy-6-oxo-4-phenyl-5,6dihydro-4H-cyclopenta[b]thiophene-5carboxylate

## C. John McAdam, Stephen C. Moratti, Jim Simpson\* and **Zheng Shi**

Department of Chemistry, University of Otago, PO Box 56, Dunedin, New Zealand Correspondence e-mail: jsimpson@alkali.otago.ac.nz

Received 7 September 2011; accepted 12 September 2011

Key indicators: single-crystal X-ray study; T = 91 K; mean  $\sigma$ (C–C) = 0.002 Å; R factor = 0.032; wR factor = 0.079; data-to-parameter ratio = 13.3.

In the title molecule,  $C_{16}H_{14}O_4S$ , the dihydrocyclopentathiophenone ring system is almost planar, with an r.m.s. deviation of 0.060 Å from the best fit plane through all nine non-H atoms. The cyclopentanone ring adopts a severely flattened envelope conformation with the C atom carrying the OH and ethylcarboxylate substituents at the flap. This atom lies only 0.185 (3) Å from the plane through the other four C atoms. The phenyl substituent is inclined at  $43.37(5)^{\circ}$  to the dihydrocyclopentathiophenone mean plane. In the crystal, molecules are linked by pairs of  $O-H \cdots O$  hydrogen bonds, forming inversion dimers with  $R_2^2(10)$  ring motifs. Weak C- $H \cdots O$  hydrogen bonds also link molecules into chains along c, while an approximately orthogonal set of C-H···O contacts form chains along b, resulting in layers lying parallel to (100). Inversion dimers also form through weaker  $R_2^2(12)$  C-H···S contacts, which combine with C-H···O contacts to form stacks along b.

## C. John McAdam, Stephen C. Moratti, Jim Simpson and Zheng Shi

## S1. Comment

There is currently much interest in research into conducting thiophene polymers (Anquetil *et al.*, 2003). Our interest in molecular actuators based on this chemistry led to the isolation of the previously unreported title compound.

In the molecular structure of the title molecule (Fig. 1), the flap atom of the severely flattened C3···C7 ring carries both hydroxy and ethylcarboxylate substituents. Atom C6 lies 0.185 (3) Å from the mean plane through atoms (C3-C5,C7) and this plane is inclined at 4.43 (8) ° to the thiophene ring (S1,C1-C4) mean plane. As a result the dihydrocyclopenta-thiophene-one ring system is also reasonably planar with a r.m.s. deviation of only 0.060 Å from the plane through all 9 non-hydrogen atoms. The C7 atom of the cyclopentane ring carries a phenyl substituent that subtends a dihedral angle of 43.37 (5) ° to the dihydrocyclopentathiophene plane. The Cambridge Crystal Structure Database (CSD, Version 5.32, last update Aug. 2011; Allen, 2002) reveals only three structures involving dihydrocyclopenta-thiophene-one ring systems (Bonini *et al.*, 2004; Chang *et al.*, 2004). In the title molecule the bond distances are normal (Allen *et al.*, 1987) and similar to those reported for these similar molecules.

In the crystal O6–H6···O5 hydrogen bonds form inversion dimers with  $R^2_2(10)$  ring motifs, (Bernstein *et al.*, 1995), Fig 2. Chains form along *c* due to weak C11–H11···O5 contacts while C1–H1..O14 contacts form chains at roughly 90 ° to these along *b*. These contacts combine to generate layers lying parallel to the (100) plane, Fig 3. Inversion dimers also form through weaker  $R^2_2(12)$  C7–H7···S1 contacts, and together with C12..H12···O14 hydrogen bonds lead to stacks along *b*, Fig 4. Additional C15..H15···O6 contacts further stabilize the packing.

## **S2. Experimental**

The precursor thiophene, ethyl 6-oxo-4-phenyl-5,6-dihydro-4*H*-cyclopenta- thiophene-5-carboxylate (EOPDCTC), was prepared by a literature procedure (Yang, 2009). EOPDCTC (315 mg, 1.1 mmol) and potassium tertiary butoxide (289 mg, 2.6 mmol) were dissolved in 2-propanol (5 ml) and iodine (280 mg, 1.1 mmol) in 2-propanol (5 ml) added dropwise under a N<sub>2</sub> atmosphere. After stirring at room temperature for 24 hrs, the solvent was removed under reduced pressure. The residues were redissolved in EtOAc, washed with saturated sodium thiosulfate and distilled water then dried over MgSO<sub>4</sub>. The crude product was purified by silica gel column chromatography with CH<sub>2</sub>Cl<sub>2</sub>/EtOAc (10%) to give a brown solid in 17% yield. X-ray quality crystals were obtained from a CH<sub>2</sub>Cl<sub>2</sub> solution of the title compound layered with hexane. *M*.p 404 K. HRMS (+ve ESI) m/z calc for C<sub>16</sub>H<sub>13</sub>O<sub>4</sub>SNa 324.0427, found 325.1152. Spectroscopic data for the title compound are available in the archived CIF.

## **S3. Refinement**

The H atom of the OH group was located in a difference Fourier map and its coordinates were refined with  $U_{iso} = 1.5U_{eq}(O)$ . All C-bound H atoms were included in calulated positions and refined using a riding model: d(C-H) = 0.95,

1.00, 0.99 and 0.98 Å, for aromatic, methylene and methyl H-atoms, respectively, with  $U_{iso} = k \times U_{eq}(C)$ , where k = 1.5 for methyl H atoms, and k = 1.2 for all other H atoms.

## Special details

**Experimental.** Spectroscopic data for the title compound: <sup>1</sup>H NMR ( $\delta$  p.p.m., CDCl<sub>3</sub>, 400 MHz): 8.08 (1*H*, d, J = 4.8 Hz, CHS), 7.35–7.28 (5*H*, m, phenyl *H*), 7.16 (1*H*, d, J = 4.8 Hz, CHCHS), 4.73 (1*H*, s, CHC<sub>6</sub>H<sub>5</sub>), 4.37 (1*H*, s, O*H*), 3.82 & 3.62 [2 *x* (1*H*, m, CH<sub>2</sub>)], 0.85 (3*H*, t, J = 7 Hz, CH<sub>3</sub>). IR *v*(CO) 1737, 1703 cm<sup>-1</sup>.

**Geometry**. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement**. Refinement of  $F^2$  against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on  $F^2$ , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating *R*-factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. *R*-factors based on  $F^2$  are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
