## 2-Trifluoromethyl-1*H*-benzimidazol-3-ium perchlorate

Ming-Liang Liu

 College of Chemistry and Chemical Engineering, Southeast University, Nanjing 210096, People's Republic of China  
 Correspondence e-mail: jgsdxlm@163.com

Received 14 September 2011; accepted 25 September 2011

 Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(\text{C}-\text{C}) = 0.005$  Å;  $R$  factor = 0.051;  $wR$  factor = 0.140; data-to-parameter ratio = 15.6.

In the title salt,  $\text{C}_8\text{H}_6\text{F}_3\text{N}_2^+\cdot\text{ClO}_4^-$ , the atoms of the benzimidazole ring (including H atoms) are nearly coplanar (r.m.s. deviation of the fitted atoms = 0.0122 Å) and the trifluoromethyl group lies out of this plane. The perchlorate anion adopts a distorted tetrahedral conformation with the Cl—O bond distances ranging from 1.412 (3) to 1.439 (2) Å. The benzimidazolium cations are linked to adjacent anions by intermolecular N—H $\cdots$ O hydrogen bonds, forming chains.

## 2-Trifluoromethyl-1*H*-benzimidazol-3-ium perchlorate

Ming-Liang Liu

### S1. Comment

Some interesting physical properties of simple molecular–ionic crystals containing organic cations and anions have been discussed by several authors (Yu *et al.*, 2004; Chen *et al.*, 2009; Ge *et al.*, 2007).

The asymmetric unit of the present compound,  $C_8H_6N_2H_6F_3^+ ClO_4^-$  consists of one 2-trifluoromethyl-1*H*-benzimidazole cation and one perchlorate anion, Figure 1.

The atoms of the benzimidazole ring (including the H atoms) are nearly co-planar with a rms deviation of the fitted atoms of 0.0122 Å. Atom C8 lies out of this plane. The perchlorate anion is a distorted tetrahedron, the average C—O bond distances range from 1.412 (3) Å to 1.439 (2) Å, the O—C—O angles range from 107.71 (17)° to 110.65 (15)°.

The 2-trifluoromethyl-1*H*-benzimidazole cations are linked to adjacent anions by intermolecular N—H⋯O hydrogen bonds to form chains, Table 1, Figure 2. The hydrogen bond involving N2—H2A is a three-centre contact to atoms O2 and O3 in which the H2A⋯O2, 2.05 Å, is shorter than the H2A⋯O3, 2.59 Å with the angles at H2A being 164° and 137° respectively. Centrosymmetrically related chains run through each unit cell and these are linked into ribbons by a  $\pi$ – $\pi$  interaction between the phenyl rings, Cg1⋯Cg1(-x,1-y,1-z), 4.039 (2) Å, perpendicular distance between rings, 3.5948 (14) Å and slippage, 1.841 Å. These ribbons run perpendicular to the *a*-axis.

### S2. Experimental

0.144 g (1 mmol) of 2-trifluoromethyl-1*H*-benzimidazole was firstly dissolved in 30 ml methanol, to which 0.1 g (1 mmol) of perchloric acid was added to give a solution without any precipitate while stirring at the ambient temperature. Single crystals suitable for X-ray structure analysis were obtained by the slow evaporation of the above solution after 2 days in air.

The dielectric constant of the compound as a function of temperature indicates that the permittivity is basically temperature-independent ( $\epsilon = C/(T-T_0)$ ), suggesting that this compound is not ferroelectric or there may be no distinct phase transition occurring within the measured temperature within the measured temperature (below the melting point).

### S3. Refinement

The asymmetric unit was selected to form a hydrogen-bonded unit. H atoms attached to C atoms were placed in calculated positions with C—H = 0.93 Å with  $U_{iso} = 1.2U_{eq}$  and allowed to ride. The H atoms attached to the N atoms were located on a difference map. The N—H distances were restrained to 0.86 Å and refined as riding atoms with  $U_{iso} = 1.2U_{eq}$  in the final cycles of refinement. The 2 0 0 reflection was omitted from the refinement because of extinction.

**Figure 1**

A view of (I) with the numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

**Figure 2**

A stereoview of part of the crystal structure of compound showing the  $\pi$ - $\pi$  linked cation-anion hydrogen-bonded ribbons. Hydrogen atoms not involved in the motifs are not included.

 $\Delta\rho_{\min} = -0.34$  e Å<sup>-3</sup>

## Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
