Correspondence e-mail: wangxq193@126.com

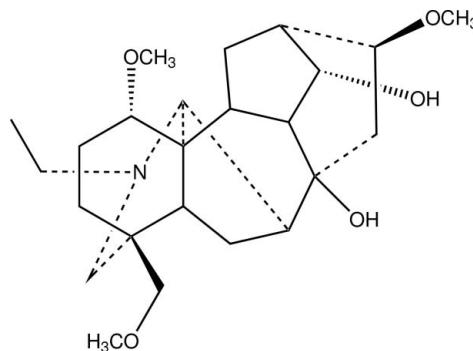

Received 28 September 2011; accepted 24 October 2011

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.044; wR factor = 0.097; data-to-parameter ratio = 9.3.

The title compound [systematic name: (1S,4S,5R,7S,8S,9R,-10R,11S,13S,14S,16S,17R)-*N*-methyl-8,14-dihydroxy-1,16-trimethoxy-4-(methoxymethylene)aconitane], C₂₄H₃₉NO₅, was isolated from the roots of *Aconitum carmichaelii* Debx., which is known as 'Chuanwu' in Chinese traditional herbal medicine. The molecule has an aconitane carbon skeleton with four six-membered rings and two five-membered rings, including a six-membered N-containing heterocyclic ring. Both five-membered rings adopt envelope conformations. The four six-membered rings adopt chair conformations. Two intramolecular O—H···O hydrogen bonds occur.

Related literature

The title compound is an aconitine-type C₁₉-diterpenoid alkaloid. For reviews of diterpenoid alkaloids, see: Wang *et al.* (2009, 2010). For the chemical structure of the title compound established from NMR and MS data, see: Pelletier *et al.* (1984). For the total synthesis of the title compound, see: Wiesner *et al.* (1974). For structures of related C₁₉-diterpenoid alkaloids, see: Gao *et al.* (2010); Tashkhodjaev & Sultan-khodjaev (2009); He *et al.* (2008). Talatisamine, a C₁₉-diterpenoid alkaloid from Chinese traditional herbal 'Chuanwu'

Jun Lei, Ya-Jun Luo, Qing-Quan Bian and Xiong-Qing Wang

S1. Comment

As a famous Chinese traditional herbal, the roots of *Aconitum carmichaeli* Debx., known as "Chuanwu", has been therapeutically used to the treatment of rheumatic pain, rheumatoid arthritis and some other inflammations. Recently, two important reviews focus on the alkaloids from the genus *Aconitum* (Wang *et al.*, 2009 and 2010). The title compound, *N*-methyl-8 β ,14 β -dihydroxy-1 α ,16 β -trimethoxy-4 β -(methoxymethylene)aconitane, talatisamine, has been isolated previously from many genus of *Aconitum*L., inculding *A. carmichaeli* Debx. (Pelletier *et al.*, 1984), and its structure was established from the NMR and MS data (Wiesner *et al.*, 1974). However, in our recent investigation, it was isolation from the root of *Aconitum carmichaeli* Debx. collected in the Jiangyou country, Sichuan Province of China in June, 2011. The crystal structure of talatisamine has not been reported. In view of this, the crystal structure determination of the title compound was carried out and the result is presented here.

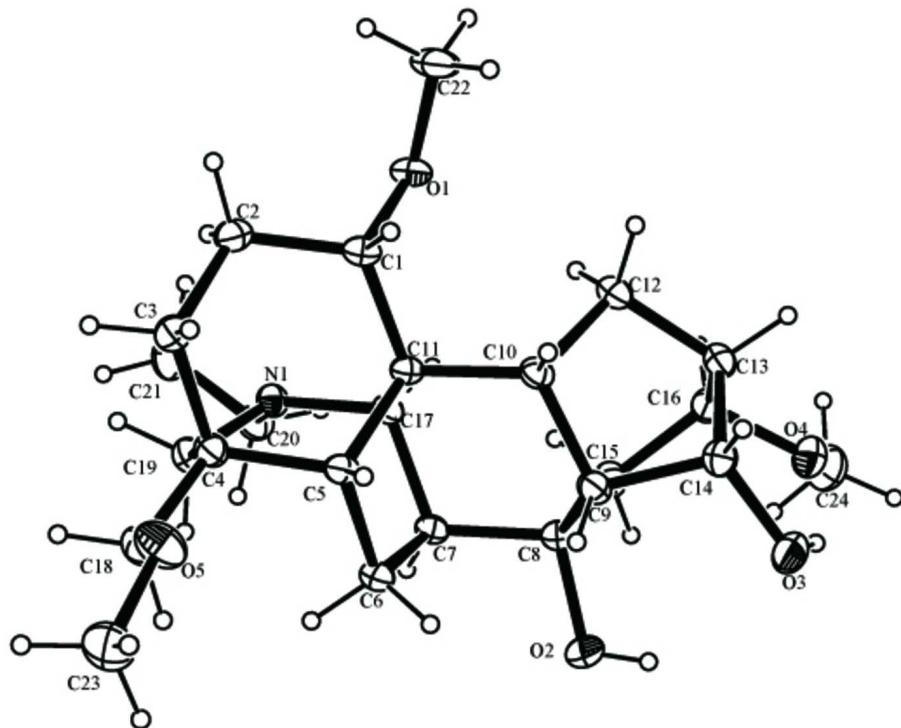

The molecular structure of the title compound is shown in Fig. 1. The molecule has a high rigid structure consisting of six main rings (A–F). Six-membered rings A (C1/C2/C3/C4/C5/C11), B (C7/C8/C9/C10/C11/C17) and D(C8/C9/C14/C13/C16/C15) adopt chair conformations; six-membered heterocyclering E (C4/C5/C11/C17/N1/C19) adopts the same chair conformation. The five-membered rings C (C9/C10/C12/C13/C14) and F (C5/C6/C7/C17/C11) display anenvelope conformation, in which, the C14 and C11 act as the "envelope atom" respectively. Two *cis*-fused ring junctions are observed between rings A/E and between B/C. Two *trans*-fused ring junctions involve rings A/B and also E/F. The crystal structure contains intermolecular O—H···O hydrogen bond between the hydroxyl group and carbonyl O atom. The absolute configuration of the title compound can not be confirmed by the present MoKa diffraction data. But it can be assumed to be the same as that reported for C₁₉-diterpenoidalkaloids from the nature (Gao *et al.*, 2010; Tashkhodjaev & Sultankhodjaev, 2009; He *et al.*, 2008; Pelletier & Djarmati, 1976; Tsuda & Marion, 1963; Zhapova *et al.*, 1986).

S2. Experimental

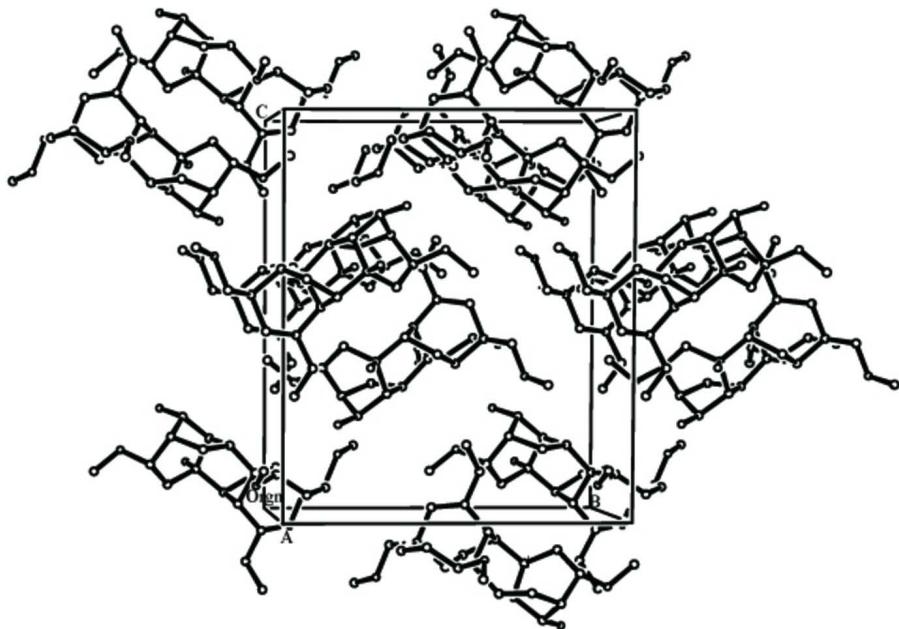

The title compound was isolated from the roots of *Aconitum carmichaeli* Debx. according to the literature procedure of Gao *et al.* (2010) and crystals of X-ray quality were grown from MeOH at room temperature by slow evaporation.

S3. Refinement

Hydroxy H atoms were located in a difference Fourier map and refined as riding in their as-found relative positions with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$. Other H atoms were located geometrically with C—H = 0.93–0.98 Å, and refined using a riding model with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for methyl and $1.2U_{\text{eq}}(\text{C})$ for the others. The absolute configuration has not been determined from the X-ray analysis, owing to the absence of strong anomalous scattering.

**Figure 1**

The molecular structure of the title compound with the atom numbering, showing displacement ellipsoids at the 30% probability level.

**Figure 2**

Molecular packing of the title compound.

 $w = 1/[\sigma^2(F_o^2) + (0.0403P)^2 + 0.3082P]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\text{max}} < 0.001$
 $\Delta\rho_{\text{max}} = 0.15$ e Å⁻³
 $\Delta\rho_{\text{min}} = -0.15$ e Å⁻³

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
