Received 19 January 2012; accepted 22 February 2012

Key indicators: single-crystal X-ray study; T = 298 K; mean σ(C–C) = 0.003 Å; R factor = 0.040; wR factor = 0.102; data-to-parameter ratio = 7.2.

In the crystal of the title compound, $C_{10}H_{11}NO_4$, the hydroxy group forms an O—H···$O_{carbonyl}$ hydrogen bond with an adjacent molecule, so forming chains which extend along (010). Further weak C—H···O hydrogen-bonding associations give an infinite three-dimensional network structure.

Related literature

S1. Comment

The title compound $C_{10}H_{11}NO_4$ (I), common name *N*-2-hydroxyethyl unsaturated norcantharidin (HEUNC), is a derivative of unsaturated norcantharidin, showing weaker anti-cancer activity than norcantharidin, possibly associated with its structure. However its single-crystal structure has not been unambiguously determined since first prepared in 2000 (Zhou & Chen, 2000). In the present work, the crystal structure of (I) is reported, and its molecular packing mode is discussed on the basis of its structure. The absolute configuration of (I) has not been determined.

The asymmetric unit of the title compound contains only one molecule (Fig. 1) in which the conformation of the *N*-substituted ethanol side chain is stabilized by intramolecular C—H···$O_{carbonyl}$ interactions (Table 1) [torsion angles C7—N1—C9—C10 and N1—C9—C10—O4, -73.826 (12) and 168.812 (9)°], respectively. If the ethanol side chain is not considered, the molecule has a *Z*-type configuration with planes C1, C4, C5, C6 (plane 1), C1, O1, C4 (plane 2) and C2, C3, C8, N1, C7, C9, O2, O3 (plane 3) all essentially planar [dihedral angles 50.161 (8)° between planes 1 and 2 and 53.439 (7)° between planes 2 and 3].

The hydroxy group forms intermolecular O—H···$O_{carbonyl}$ hydrogen bonds (Table 1) giving chains which extend along (010) (Fig. 2). Each molecule (shown as *O*) gives further weak C—H···O hydrogen-bonding associations with six surrounding molecules (*A–F*) (Fig. 2), in which molecules *B, D, E, F* and *O* are nearly co-planar, with *A* and *C* lying on either side of the plane. An overall three-dimensional network structure is formed (Fig. 3).

At first glance, the hydrogen-bonded net found in (I) may be considered distorted primitive cubic with a long vertex symbol (4.4.4.4.4.4.4.4.4.4.4.4.*.*.*.*.) (Braga & Grepioni, 2007) but there is a difference in connectivity along the sloping plane [Miller Index (0.74 0 0.67)] with 4-membered or 6-membered primitive rings occurring from each of the 15 (6*5/2) angles, actually giving a long vertex symbol of (4.4.4.4.4.4.4.4.6.6.6.6.6.6.6.6.) (Figs. 4, 5).

S2. Experimental

For the synthesis of the title compound, see: Gramlich *et al.* (2010); William *et al.* (2008). Elemental analysis: Calcd: C 57.41; H 5.30; N 6.70%. Found: C 57.35; H 5.23; N 6.76%.

S3. Refinement

The hydroxy H atom was located in a difference-Fourier map and both positional and isotropic displacement parameters were refined. Other H-atoms were included in calculated positions and were allowed to ride on the parent atom with C—H = 0.93–0.98 Å and with U_{iso} = 1.2U_{eq}(C). In the absence of a suitable heavy atom in the structure, Friedel pairs (757) were merged for the final stages of refinement. The described molecule has the (C1*S*,C2*R*,C3*S*,C4*R*) relative configuration.

Refinement

Refinement on F^2
Least-squares matrix: full
$R[F^2 > 2\sigma(F^2)]$ = 0.040
$wR(F^2)$ = 0.102
S = 1.05
1017 reflections
141 parameters
2 restraints
Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w = 1/[\sigma^2(F_o^2) + (0.0815P)^2 + 0.0262P]$ where $P = (F_o^2 + 2F_c^2)/3$
$(\Delta/\sigma)_{max} < 0.001$
$\Delta\rho_{max} = 0.21$ e Å^{-3}
$\Delta\rho_{min} = -0.25$ e Å^{-3}
Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^* = kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Extinction coefficient: 0.049 (13)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
