Received 22 February 2012; accepted 24 February 2012

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.052; wR factor = 0.161; data-to-parameter ratio = 25.6.

In the title hydrated molecular salt, $\text{C}_{38}\text{H}_{52}\text{N}_4^{2+} \cdot 2\text{Br}^- \cdot \text{H}_2\text{O}$, the central benzene ring of the dication makes dihedral angles of 89.47 (13) and 72.69 (12) $^\circ$ with the pendant benzimidazol-3-ium rings. The conformations of the octyl side chains are completely different. In the crystal, the components are linked by $\text{O}-\text{H}\cdots\text{Br}$, $\text{C}-\text{H}\cdots\text{Br}$ and $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds into a two-dimensional network lying parallel to the ac plane. Aromatic $\pi-\pi$ stacking interactions are also observed [shortest centroid-to-centroid separation = 3.5047 (16) \AA].

3,3'-[1,2-Phenylenebis(methylene)]bis(1-octylbenzimidazolium) dibromide monohydrate

Rosenani A. Haque, Muhammad Adnan Iqbal, Hoong-Kun Fun and Suhana Arshad

S1. Comment

As a part of our ongoing studies, we have previously reported crystal structures of *ortho*-xylyl linked bis-benzimidazolium salts with ethyl (Haque *et al.*, 2012), propyl (Iqbal *et al.*, 2012), and heptyl (Haque *et al.*, 2011) substitutions. In this paper we describe single-crystal X-ray diffraction study of the title compound, (I) (Fig. 1).

Bond lengths and angles are comparable to the related structure (Haque *et al.*, 2011). The central benzene (C9–C14) ring makes dihedral angles of 89.47 (13) and 72.69 (12) $^{\circ}$ with the terminal 1*H*-benzo[*d*]imidazol-3-i um (N1/N2/C1–C7) and (N3/N4/C16–C22) rings, respectively.

The crystal structure is shown in Fig. 2. The cations, anions and water molecules are linked by intermolecular O—H···Br, C—H···Br and C—H···O hydrogen bonds (Table 1) into a two-dimensional network parallel to the *ac* plane. π — π interactions of $Cg1\cdots Cg3 = 3.5622$ (18) Å (symmetry code: 3 - x , 1 - y , 1 - z), $Cg3\cdots Cg3 = 3.7158$ (18) Å (symmetry code: 3 - x , 1 - y , 1 - z), $Cg2\cdots Cg4 = 3.6206$ (17) Å (symmetry code: 2 - x , 1 - y , - z) and $Cg4\cdots Cg4 = 3.5047$ (16) Å (symmetry code: 2 - x , 1 - y , - z) further stabilized the structure. [$Cg1$, $Cg2$, $Cg3$ and $Cg4$ is the centroid of the N1/N2/C1/C6/C7, N3/N4/C16/C17/C22, C1–C6 and C17–C22 rings, respectively].

S2. Experimental

A mixture of benzimidazole (5.90 g, 50 mmol) and finely ground potassium hydroxide (4.50 g, 80 mmol) in 50 ml of DMSO was stirred at room temperature (27–28 °C) for 30 min. 1-Bromo octane (8.70 ml, 50 mmol) was added drop-wise into this consistently stirred mixture with further stirring for 2 h at the same temperature. The mixture was then poured into water (700 ml) and was extracted by chloroform (5×30 ml). The extract was dried by filtering through five plies of Whatman filter papers. This process was repeated twice to collect crystal a clear solution which was evaporated under reduced pressure to get *N*-octylbenzimidazole (1) as a thick yellowish fluid. Furthermore, a mixture of 1 (4.04 g, 20 mmol) and 1,2-bis(bromomethyl)benzene (2.64 g, 10 mmol) in 1,4-dioxane (50 ml) was refluxed at 100 °C for 18 h. After cooling the reaction mixture to room temperature, the desired compound (2.2Br) appeared as white crystalline powder. The salt was filtered and washed by fresh 1,4-dioxane (3×5 ml), dried at room temperature for 24 h. The product was collected as white crystalline powder (7.42 g, 97.76%). Saturated solution of 2.2Br in methanol (0.5 ml) was exposed to diethyl ether vapours (vapour diffusion) at room temperature to get colourless blocks of (I). Single crystals were also obtained by slow evaporation of saturated solution of 2.2Br in MeOH/CH₃CN (70:30) and by evaporating saturated solution of title compound in *d*₆-DMSO at room temperature.

S3. Refinement

The H atoms of the water molecule were located in a difference Fourier map and refined freely [O—H = 0.84 (5) and 0.83 (5) Å]. All the other H atoms were positioned geometrically [C—H = 0.95–0.99 Å] and refined using a riding model

with $U_{\text{iso}}(\text{H}) = 1.2$ or $1.5U_{\text{eq}}(\text{C})$. A rotating group model was applied to the methyl groups.

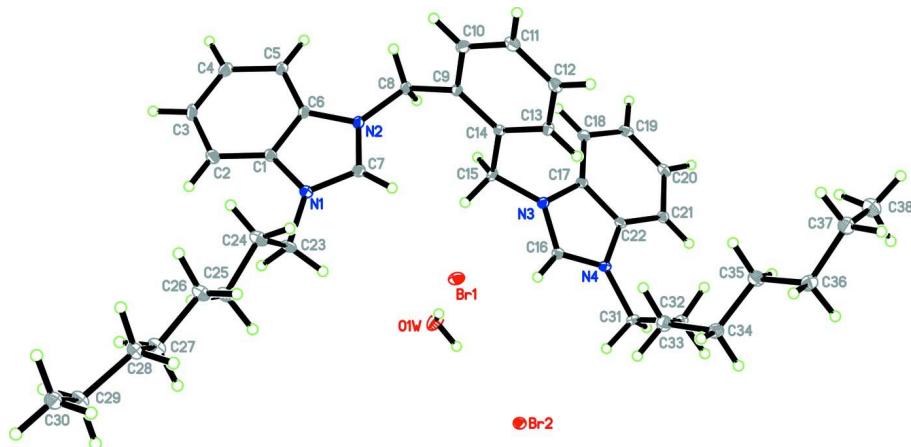

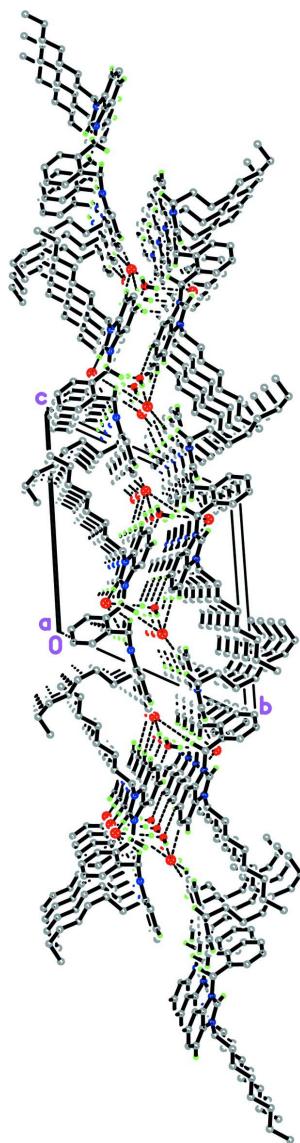

Figure 1

The molecular structure of the title compound, showing 30% probability displacement ellipsoids.

**Figure 2**

The crystal packing of the title compound. Those H atoms not involved in the intermolecular interactions (dashed lines) have been omitted for clarity.

and constrained refinement
 $w = 1/[\sigma^2(F_o^2) + (0.1139P)^2 + 0.460P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 2.62$ e \AA^{-3}
 $\Delta\rho_{\min} = -1.68$ e \AA^{-3}

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
