Received 25 February 2012; accepted 6 March 2012

Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(\text{C}-\text{C}) = 0.004$  Å;  $R$  factor = 0.037;  $wR$  factor = 0.091; data-to-parameter ratio = 16.7.

In the binuclear title compound,  $[\text{Cu}_2(\text{NO}_2)_4(\text{C}_4\text{H}_6\text{N}_2)_4]$ , centrosymmetrically related complex molecules are linked *via* weak Cu—O interactions, forming dimeric units. The Cu<sup>II</sup> atom displays an elongated square-pyramidal  $\text{CuN}_2\text{O}_3$  coordination geometry with a slight tetrahedral distortion of the basal plane [maximum deviation = 0.249 (2) Å]. The dihedral angle formed by the imidazole rings is 26.20 (10)°.

### Related literature

The structure of the title compound was determined as part of our ongoing study of potential ferroelectric phase change materials. For general background to ferroelectric compounds with metal-organic framework structures, see: Fu *et al.* (2009); Ye *et al.* (2006); Zhang *et al.* (2008, 2010). For a related structure, see: Costes *et al.* (1995).

**Bis( $\mu$ -nitrito- $\kappa^2$ O:O)bis[bis(1-methyl-1*H*-imidazole- $\kappa$ N<sup>3</sup>)(nitrito- $\kappa$ O)copper(II)]****Run-Qiang Zhu****S1. Comment**

As part of our ongoing study of potential ferroelectric phase change materials we have determined the structures of several copper complexes and examined the changes in their dielectric constants with temperature, which is the usual method for detecting such behaviour (Fu *et al.*, 2009; Ye *et al.*, 2006; Zhang *et al.*, 2008; Zhang *et al.*, 2010).

Unfortunately, the dielectric constant of the title compound indicates the onset of a ferroelectric phase change over the range 80–298 K.

As show in Fig. 1, the copper ion adopts an elongated square pyramidal geometry with a slight tetrahedral distortion in the basal plane (maximum deviation 0.249 (2) Å for atom N4) which is primarily associated with the coordination of the nitrite ions (O2—Cu1—O3 = 167.15 (8)°). As observed in a related compound (Costes *et al.*, 1995), this geometry displaces atom O2 from the ideal coordination plane towards the centrosymmetrically related Cu1<sup>i</sup> copper atom [symmetry code: (i) 1-x, 1-y, -z] resulting in an O2—Cu1 distance of 2.578 (5) Å. While this distance is considerably longer than those in basal plane (Cu1—O2 and Cu1—O3 are 2.0221 (19) and 2.0085 (19) Å, respectively), the direction of the displacement of atom O2 and the orientations of the two nitrite ligands which place both atoms O1 and O3 on the opposite side of the coordination plane, suggest that there is a weak association of one complex molecule with its centrosymmetrically related. The dihedral angle formed by the *trans*-arranged imidazole rings is 26.20 (10)°. The crystal packing (Fig. 2) is governed only by van der Waals interactions.

**S2. Experimental**

An aqueous solution of 1-methylimidazole (2.0 g, 25 mmol) and H<sub>2</sub>SO<sub>4</sub> (12.5 mmol) was treated with CuSO<sub>4</sub> (250 g, 12.5 mmol). After the mixture was stirred for a few minutes, Ba(NO<sub>2</sub>)<sub>2</sub> (6.18 g, 25 mmol) was added to give a blue solution. Slow evaporation of the solution following removal of the precipitated BaSO<sub>4</sub> yielded blue crystals after a few days. M. p. 319–329 K.

**S3. Refinement**

All H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms with C—H = 0.93–0.96 Å, and with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{iso}}(\text{C})$  or  $1.5 U_{\text{iso}}(\text{C})$  for methy H atoms.

Figure 1

Partial packing diagram of the title compound, with displacement ellipsoids drawn at the 30% probability level. The weak Cu—O interactions are shown as dashed lines. Primed atoms are generated by the symmetry operator: (') 1-x, 1-y, -z.

Figure 2

Packing diagram of the title compound. The weak Cu—O interactions are shown as dashed lines.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
