Received 2 March 2012; accepted 5 March 2012

Key indicators: single-crystal X-ray study; $T = 150$ K; mean $\sigma(\text{C}-\text{C}) = 0.005$ Å; R factor = 0.041; wR factor = 0.092; data-to-parameter ratio = 16.2.

The title molecule, $\text{C}_9\text{H}_{10}\text{BrNO}_2$, excluding methylene H atoms and the C—OH group, is essentially planar, with a maximum deviation of 0.037 (2) Å for the N atom. The N—C—C—O torsion angle is -63.1 (3)°. The molecular structure is stabilized by a weak intramolecular N—H...O(carbonyl) hydrogen bond, forming an $S(6)$ motif. In the crystal, molecules are linked by O—H...O and C—H...O hydrogen bonds, forming a three-dimensional network.

S1. Comment

The amino alcohol functionality is present in many classes of compounds having chemotherapeutic activity (Erdemir, 2012; Rubinstein & Svendsen, 1994; Thomas *et al.*, 1990). In addition, phenolic compounds containing the aminoalcohol grouping in *ortho* positions act as excellent bidentate ligands for the formation of several metal complexes (Chakravarthy & Chand, 2011).

As an extension of our work on the reactivity of primary aminoalcohols in three-component reactions, the title compound has been isolated as a secondary product from the one-pot reaction of (2*E*)-3-(4-methylphenyl)-1-phenylprop-2-en-1-one (chalcone), 5-bromo-2-hydroxybenzaldehyde and aminoethanol under mild conditions.

As shown in Fig. 1, excluding methylene H atoms and the C—OH group, the molecule is essentially planar, with a maximum deviation of 0.037 (2) Å for N1. The N1—C8—C9—O2 torsion angle is -63.1 (3)°. The bond lengths (Allen *et al.*, 1987) and angles have normal values.

The molecular structure is stabilized by a weak intramolecular N—H···O hydrogen bond, which generates an S(6) ring motif (Bernstein *et al.*, 1995; Etter *et al.*, 1990). In addition, intermolecular O—H···O and C—H···O hydrogen bonds (Table 1, Fig. 2) contribute to the stability of the crystal structure, linking the molecules into a three-dimensional network.

S2. Experimental

The title compound has been obtained as a secondary product from a multicomponent reaction mixture of (2*E*)-3-(4-methylphenyl)-1-phenylprop-2-en-1-one (0.01 mol), 5-bromo-2-hydroxybenzaldehyde (0.01 mol) and aminoethanol (0.01 mol). The mixture was heated at 353 K in ethanol for 4 h, monitored by TLC until the reaction was completed and then cooled to room temperature. The solvent was evaporated under vacuum and the residual oil was triturated with water to afford a brown precipitate which was filtered off, washed with water and dried in a desiccator. Pale yellow plate crystals for x-ray diffraction were obtained by dissolving the product in ethanol at room temperature and leaving it to evaporate slowly over four days. 43% yield; m.p. 355 K.

S3. Refinement

H atoms were positioned geometrically and refined using a riding model with $C_{sp^2}-H = 0.93$ Å, $C(\text{methylene})-H = 0.97$ Å, $O-H = 0.82$ Å and $N-H = 0.86$ Å; $U_{iso}(H) = xU_{eq}(C,N,O)$, where $x = 1.5$ for hydroxyl H and 1.2 for all other H atoms.

Figure 1

The molecular structure, showing displacement ellipsoids drawn at the 50% probability level. Hydrogen atoms are shown as spheres of arbitrary radius.

Figure 2

View of the packing down the *a* axis. Dashed lines indicate hydrogen bonds. H atoms not involved in hydrogen bonding have been omitted for clarity.

 $(\Delta/\sigma)_{\max} = 0.001$
 $\Delta\rho_{\max} = 0.50 \text{ e \AA}^{-3}$
 $\Delta\rho_{\min} = -0.81 \text{ e \AA}^{-3}$

Special details

Geometry. Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted R -factors wR and all goodnesses of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating $-R$ -factor-obs *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
