Received 5 April 2012; accepted 16 April 2012

Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.042; wR factor = 0.123; data-to-parameter ratio = 9.4.

The title molecule, $\text{C}_{13}\text{H}_8\text{N}_4$, is essentially planar [r.m.s. deviation for all non-H atoms = 0.025 (3) Å]. In the crystal, molecules are connected through one weak bifurcated N—H···(N,N) hydrogen bond and three π – π stacking interactions between pyridine and imidazole rings [centroid–centroid distance = 3.631 (8) Å] and between pyridine and benzene rings [centroid–centroid distances = 3.675 (5) and 3.666 (2) Å].

5H-Imidazo[4,5-f][1,10]phenanthroline**Shao-Wei Tong, Wen-Dong Song, Dong-Liang Miao and Jing-Bo An****S1. Comment**

(1,10)phenanthroline is widely used to synthesize metal-complex as a auxiliary ligand. In our laboratory earlier studies, we have successfully obtained some metal-complex with (1,10)phenanthroline. We report here the crystal structure of the title compound, Fig. 1. The title compound, is essentially planar (r.m.s. deviation for all non-H atoms = 0.025 (3) Å). In the crystal the molecules are connected through one weak bifurcated N—H···N hydrogen bonds, Fig. 2, Table 1 and π - π stacking interactions between pyridine and imidazole rings [distance centroid – centroid 3.631 (8) Å] and between pyridine and benzene rings [distance centroid–centroid 3.675 (5); 3.666 (2) Å] respectively.

S2. Experimental

Imidazo(4,5-f)(1,10)phenanthroline was purchased from Jinan Henghua science and technology limited company and recrystallized of an alkaline solution.

S3. Refinement

All H-atoms in this structure were located from differences Fourier syntheses and were refined isotropically.

 $l = -20 \rightarrow 20$

Refinement

Refinement on F^2
 Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.042$
 $wR(F^2) = 0.123$
 $S = 1.00$
 1756 reflections
 186 parameters
 0 restraints
 Primary atom site location: structure-invariant
 direct methods

Secondary atom site location: difference Fourier
 map
 Hydrogen site location: inferred from
 neighbouring sites
 All H-atom parameters refined
 $w = 1/[\sigma^2(F_o^2) + (0.0606P)^2]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 0.18\text{ e \AA}^{-3}$
 $\Delta\rho_{\min} = -0.15\text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F , and R- factors based on ALL data will be even larger.
