Received 23 March 2012; accepted 28 March 2012

Key indicators: single-crystal X-ray study; T = 150 K; mean σ(C–C) = 0.003 Å; R factor = 0.035; wR factor = 0.076; data-to-parameter ratio = 19.3.

The title compound, $[Zn(C_{15}H_{14}N_3S_2)_2]$, contains two chemically equivalent Schiff base anions that are coordinated to the Zn^{II} ion as tridentate *N*,*N*′,*S*-chelating ligands, creating a distorted octahedral environment [the smallest angle being 75.40 (6)° and the widest angle being 162.87 (6)°], with the two S atoms in *cis* positions. The dihedral angle between the mean planes of the two coordinating ligands is 85.65 (5)°. Weak C—H···S hydrogen bonds are also observed.

S1. Comment

The title compound was preferentially formed during the attempt to complex the tridentate Schiff base with zinc(II) saccharinate. The saccharinate anion was eliminated in this process and two tridentate deprotonated Schiff base moieties coordinated instead with the zinc(II) cation as determined by its infrared spectrum, elemental analysis and crystal structure analysis.

The bidentate ligands coordinate through their pyridine nitrogen, azomethine nitrogen and thiolate sulfur atoms. The environment around the Zn^{II} ion is distorted octahedral (Fig. 1) with N—Zn—N, N—Zn—S and S—Zn—S angles between 75.40 (6)° and 162.87 (6)°. The deprotonation of the ligands is accompanied by their tautomerism to the imino-thiolate forms. While coordinating in the iminothiolate form, the negative charge generated upon deprotonation is delocalized in the C—N—N—C system as observed by their intermediate bond lengths: C104—N103 = 1.311 (3) Å, N103—N102 = 1.384 (2) Å, N102—C101 = 1.276 (3) Å and C204—N203 = 1.311 (3) Å, N203—N202 =1.380 (3) Å, N202—C201 =1.281 (2) Å. Similar bond lengths and angles have been observed in the octahedral zinc(II) complex containing the pyridine-2-aldehyde Schiff base of *S*-benzyldithiocarbazate (Tarafder *et al.*, 2001) for which C—N bond lengths ranging from 1.273 to 1.320 Å and N—N bond lengths of 1.374 to 1.379 Å were reported. In the title complex, the two ligands are coordinated to the zinc(II) ion in a meridional configuration, where the two thiolate S atoms (S105 & S205) and the two pyridine N atoms (N115 & N215) are *cis* to each other and the two azomethine N atoms *trans* (N102 & N202) as in other bis-ligand metal complexes of related NNS tridentate ligands (Tarafder *et al.*, 2001). The angle between the planes defined by Zn1—S205—C204—N203—N202—C201—C214—N215 (minimum deviation: 0.001 and maximum deviation: 0.157 Å), and Zn1—S105—C104—N103 –N102—C101—C114—N115 (minimum deviation: 0.011 and maximum deviation: 0.212 Å) is 85.65 (5)° showing that the planes are almost orthogonal to each other thus defining an distorted octahedral arrangement.

The angle between the planes defined by the benzyl ring (C208—C213) and the pyridyl ring (C214—C219) is 84.39 (12)°; however, the angle between the planes defined by the corresponding benzyl (C108—C113) and pyridyl rings (C114—C119) in the other Schiff base moiety is 75.06 (12)°. Both planes of the benzyl ring moieties of the Schiff bases are slightly displaced at an angle of 15.05 (10)°, but the distance between them precludes π—π interaction. The pyridyl rings on both Schiff bases are almost orthogonal to each other at an angle of 85.06 (11)°.

The Zn^{II}-donor atom bond lengths Zn—S [2.485 (6), 2.5263 (6) Å], Zn—N_{py} [2.2117 (17), 2.2692 (16) Å] and Zn—N_{imine} [2.1005 (16), 2.1032 (17) Å] compare well with a related octahedral Zn^{II} complex containing a pyridine-2-aldehyde Schiff base of S-benzyldithiocarbazate with Zn—N distances between 2.126 and 2.347 Å and Zn—S distances between 2.4514 and 2.4540 Å which are normal for multidentate bonding (Tarafder *et al.*, 2001). Although none of the bond angles in the complex conformed to the ideal values expected of a regular octahedral geometry, this appears to be

common in six-coordinate metal complexes of Schiff base ligands derived from dithiocarbazic acid and is attributed to the restricted bite angles of the planar NNS tridentate ligands. (Ali *et al.*, 2001; Tarafder *et al.*, 2001). Weak C—H···S hydrogen bonds are observed and may consolidate the crystal packing (Fig. 2, Table 2).

Further background on the coordination chemistry of hydrazine carbodithioates is given by Ravoof *et al.* (2010).

S2. Experimental

Zinc(II) saccharinate, $[Zn(sac)_2(H_2O)_4]\cdot 2H_2O$ was synthesized using a similar procedure as for the synthesis of Cu(II) saccharinate (Ravoof *et al.* (2004)). The title compound was synthesized following the procedure by Ali *et al.* (1997). The Schiff base was dissolved in acetonitrile (50 ml) and mixed with an equimolar quantity of zinc(II) saccharinate in acetonitrile (25 ml). The resulting mixture was heated on a water bath until the volume reduced to *ca* 30 ml. On standing overnight in the fridge, the mixture yielded yellow crystals suitable for X-ray analysis.

S3. Refinement

H atoms were all located in difference maps; those attached to carbon atoms were repositioned geometrically. The H atoms were initially refined with soft restraints on the bond lengths and angles to regularize their geometry (C—H in the range 0.93–0.98, N—H in the range 0.86–0.89 Å) and U_{iso}(H)(in the range 1.2–1.5 times U_{eq} of the parent atom), after which the positions were refined with riding constraints.

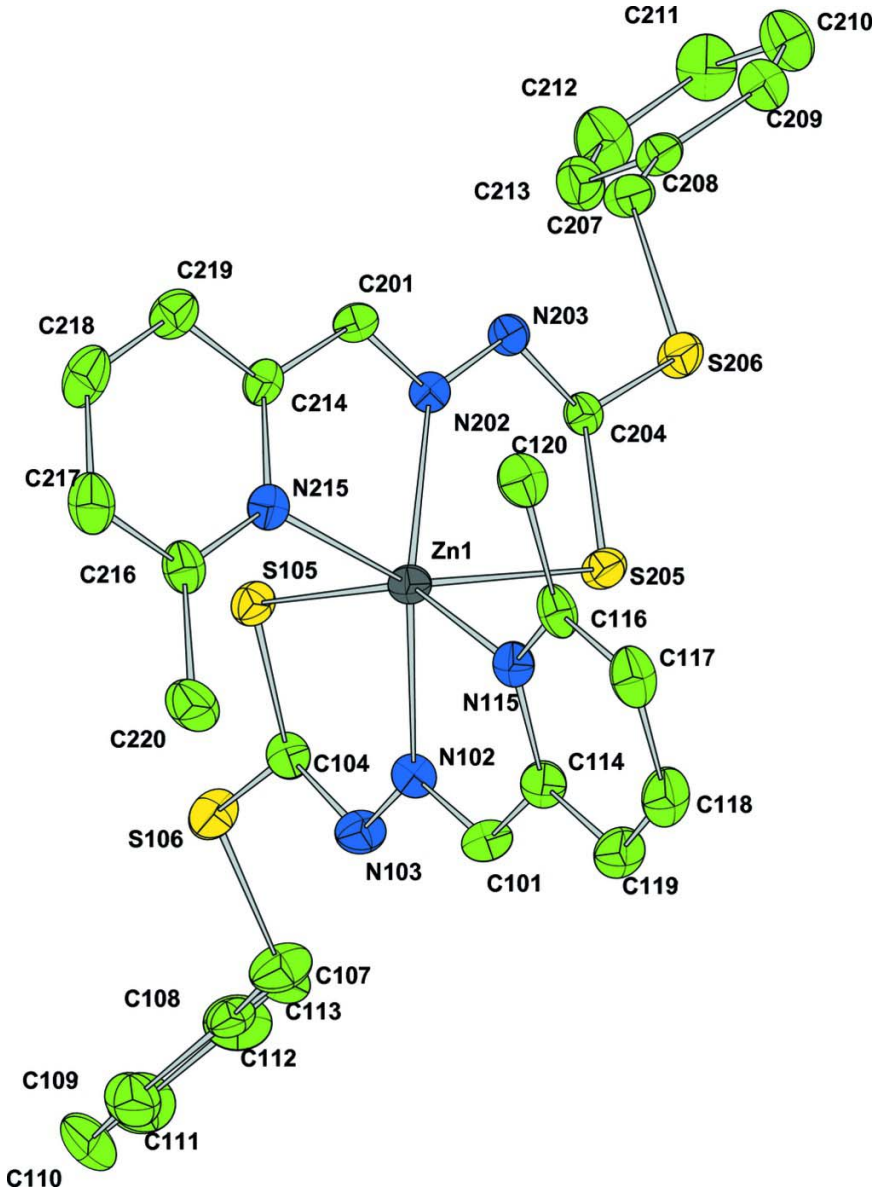

Figure 1

The title compound with displacement ellipsoids drawn at the 50% probability level. H atoms are omitted for clarity.

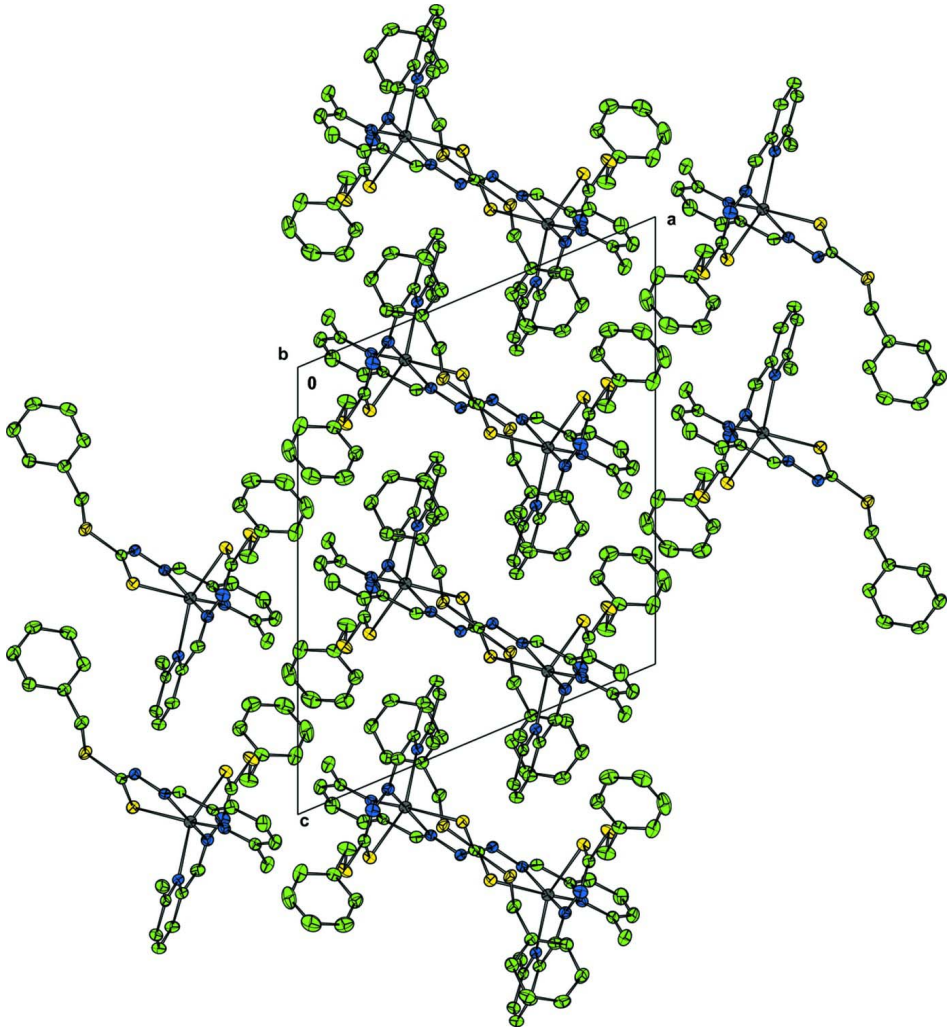

Figure 2

Molecular packing diagram of the title compound viewed along the *b* axis. Hydrogen atoms are omitted for clarity.
