Received 27 April 2012; accepted 29 April 2012

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.002 Å; R factor = 0.031; wR factor = 0.088; data-to-parameter ratio = 14.3.

In the title compound, $C_{20}H_{13}ClN_2O_2S$, the chlorophenyl, phenyl and thienoyl rings are oriented at dihedral angles 17.84 (7), 53.13 (8) and 34.03 (8)°, respectively, to the central pyrazole ring. An intramolecular O—H···O hydrogen bond occurs. In the crystal, pairs of bifurcated O—H···O hydrogen bonds link molecules into inversion dimers with $R_2^2(12)$ graph-set motifs.

S1. Comment

Pyrazolone, as a prominent structural motif, is found in numerous active compounds. Due to the easy preparation and its rich biological activity of broad-spectrum antibacterial action, antitumor, antisepsis(Kimata *et al.*, 2007). Pyrazolone and its complexes have both received considerable attention in coordination chemistry and medicinal chemistry(Li *et al.*, 2000).We report here the crystal structure of a new 4-heterocyclic acylpyrazolone (Fig. 1).

The chlorophenyl ring is slightly twisted by 17.84 (1) with respect to the pyrazolone ring, whereas the benzene and 2-thienoyl rings make dihedral angles of 53.13 (3) and 34.03 (1), respectively, with the pyrazolone (Fig. 1). The clear evidence of the hydroxyl H atom in the difference Fourier synthesis and the absence of any residual electron density in the vicinity of C7 confirm that compound (I) crystallizes as a pure enol tautomer and that no desmotropism is present (Foces-Foces *et al.*, 1997).

The molecular structure of (I) is shown in Fig. 1, and the intermolecular O—H···O hydrogen bond (Table 1) results in the formation of a dimer with an $R_2^2(12)$ graph-set motif(Etter *et al.*, 1990)(Fig. 2.). The bond lengths and angles are within normal ranges (Allen *et al.*, 1987). Similar crystal structure of some compounds have been reported (Li *et al.*, 2007; Cingolani *et al.*, 2004; Holzer *et al.*., 1999).

S2. Experimental

Compound (I) was synthesized and purified according to the method proposed by Jensen (1959). (yield 72.4%.). Analysis, required for $C_{20}H_{13}ClN_2O_2S$: C 63.07, H 3.44, N 9.31%, S 8.42; found: C 63.01, H 3.53, N 9.34%, S 8.47. Block-like yellow single crystals of (I) were grown from an ethanol solution by slow evaporation for several weeks.

S3. Refinement

The hydroxyl H atom was located in a difference Fourier map and refined as riding, with O—H distance restraint of 0.82 (1) Å and with U_{iso}(H) = 1.5U_{eq}(O). Other H atoms were placed in calculated positions and constrained to ride on their parent atoms, with C—H = 0.93 Å, and with U_{iso}(H) = 1.2U_{eq}(C).

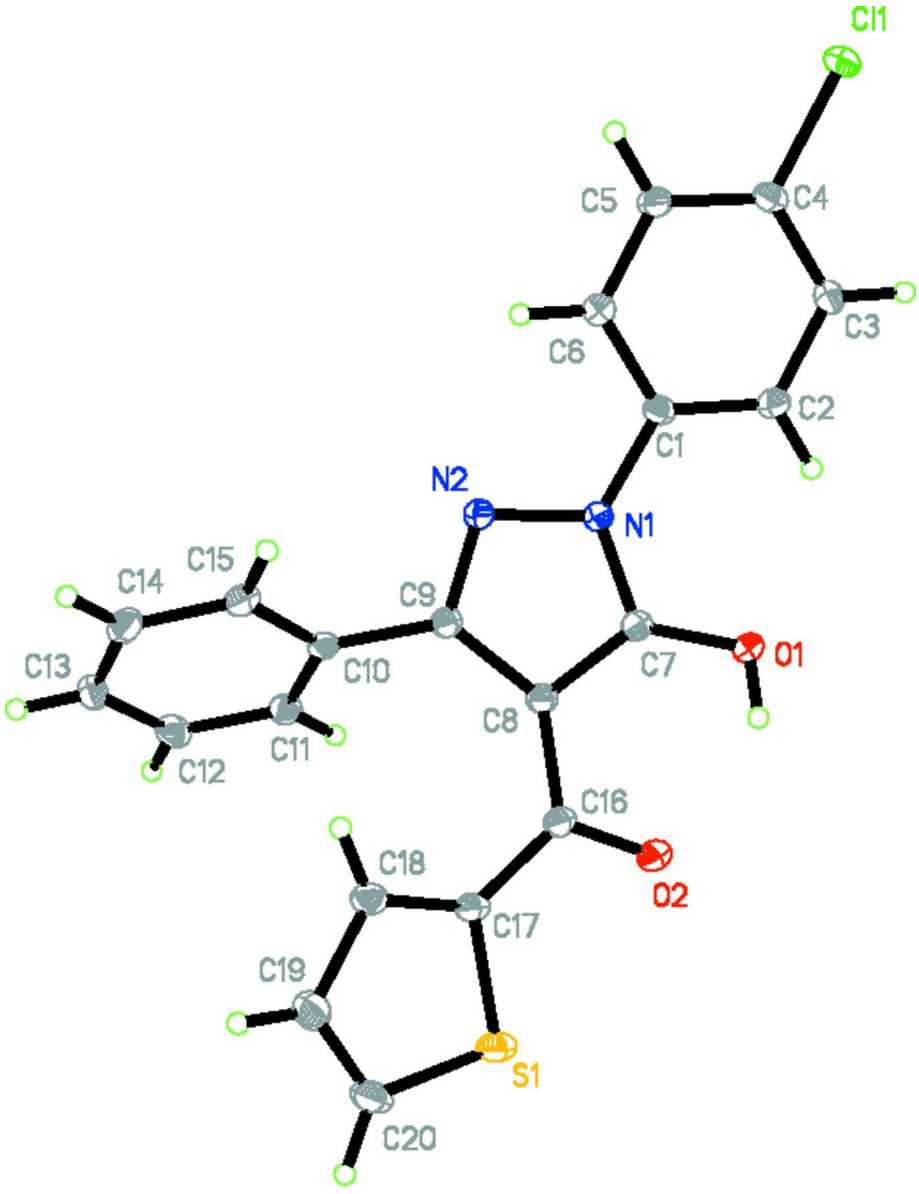

Figure 1

The molecular structure of (I) (thermal ellipsoids are shown at 30% probability levels).

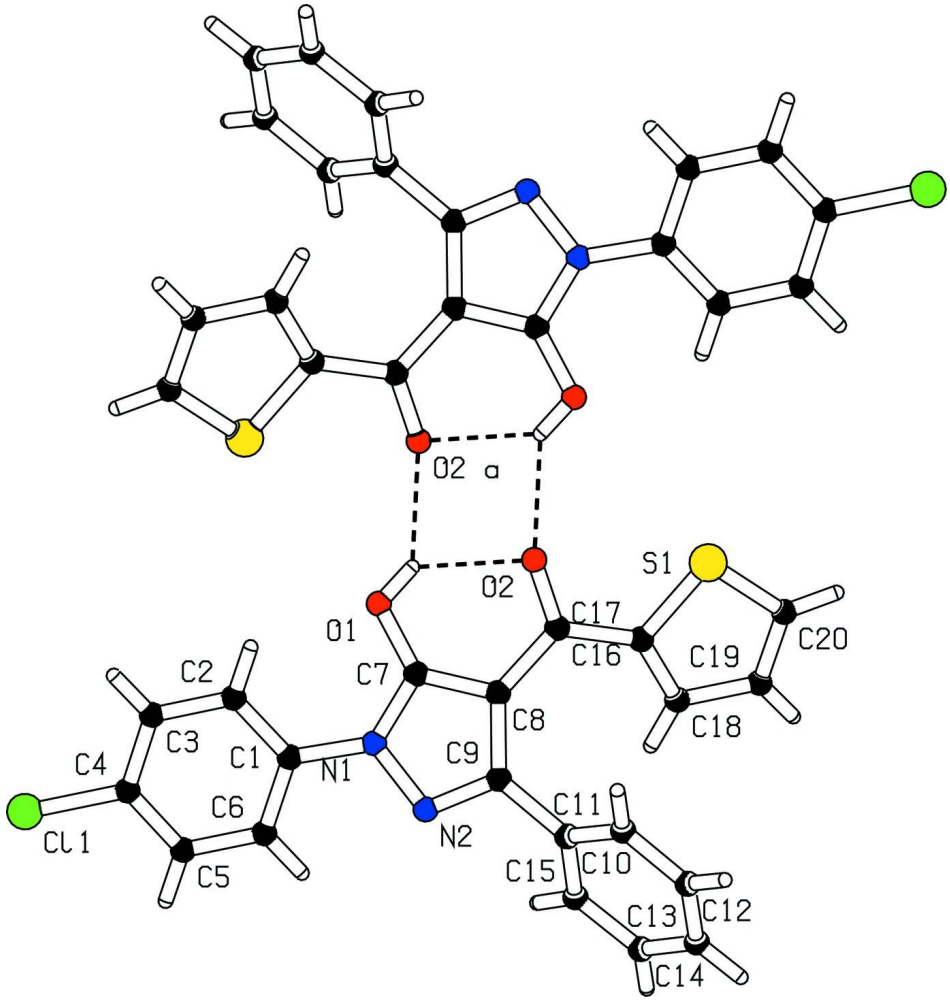

Figure 2

The structure of a dimer of (I).

235 parameters
0 restraints
Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H-atom parameters constrained
$w = 1/[\sigma^2(F_o^2) + (0.0494P)^2 + 0.8P]$ where $P = (F_o^2 + 2F_c^2)/3$
$(\Delta/\sigma)_{max}$ = 0.002
$\Delta\rho_{max}$ = 0.31 e Å^{-3}
$\Delta\rho_{min}$ = −0.31 e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
