5-(4-Chlorophenyl)-2-fluoropyridine

Muhammad Adeel, Fazal Elahi, M. Nawaz Tahir, Azim Khan and Peter Langer

S1. Comment

The title compound (I), (Fig. 1) is prepared as a precursor and for the study of biological activities.

We have reported the crystal structure of 5-(4-fluorophenyl)-2-fluoropyridine previously (Elahi *et al.*, 2012) which is related to (I). In (I) the chlorobenzene A (C1–C6/CL1) and the 2-fluoropyridine B (C7–C11/N1/F1) are planar with r.m.s. deviations of 0.0093 Å and 0.0064 Å. The dihedral angle between A/B is 38.82 (5)°. There does not exist any kind of π -interactions and the molecules must be stabilized due to van Der Waals forces.

S2. Experimental

To a 5 ml solution of 5-bromo-2-fluoropyridine (0.1 g, 0.568 mmol), 4-chlorophenylboronic acid (0.097 g, 0.624 mmol) in dioxane and K_3PO_4 (0.132 g, 0.624 mmol) was added $Pd(PPh_3)_4$ (1.5 mole %) at 373 K under N_2 atmosphere. The reaction mixture was refluxed for 8 h. Then 20 ml of distilled water was added to the reaction mixture. The aqueous layer was extracted three times with CH_2Cl_2 (3 \times 15 ml). The organic layer was evaporated *in vacuo* and the title compound (I) was obtained as a colorless crystalline solid. Yield: 0.106 g, 91 %. M.p. 344–347 K. Crystallization from a saturated $CHCl_3/CH_3OH$ solution gave colorless crystals.

S3. Refinement

The H-atoms were positioned geometrically ($C-H = 0.93$ Å) and refined as riding with $U_{iso}(H) = xU_{eq}(C)$, where $x = 1.2$ for all H-atoms.

Primary atom site location: structure-invariant direct methods	Absolute structure parameter: $-0.09 (8)$
Secondary atom site location: difference Fourier map	

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
