Received 11 June 2012; accepted 13 June 2012

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.002$ Å; R factor = 0.021; wR factor = 0.048; data-to-parameter ratio = 31.5.

The title compound, $\text{C}_{16}\text{H}_{11}\text{BrN}_2\text{O}_2 \cdot \text{H}_2\text{O}$, exists in a *trans* conformation with respect to the $\text{N}=\text{C}$ bond [1.2815 (14) Å] and the benzofuran ring system forms a dihedral angle of 2.96 (5)° with the benzene ring. In the crystal, the ketone O atom accepts two $\text{O}-\text{H} \cdots \text{O}$ and one $\text{C}-\text{H} \cdots \text{O}$ hydrogen bond, and the water O atom accepts an $\text{N}-\text{H} \cdots \text{O}$ interaction. Together, these lead to infinite layers lying parallel to (100).

N'*-[*(E)*-4-Bromobenzylidene]-1-benzofuran-2-carbohydrazide monohydrate*Hoong-Kun Fun, Ching Kheng Quah, Nitinchandra, Balakrishna Kalluraya and M. Babu****S1. Comment**

As part of our ongoing synthetic and structural studies of hydrazones with possible biological activities (Fun *et al.*, 2012*a,b*), the title compound, (I), was synthesized and its crystal structure is now reported.

The title compound (Fig. 1) crystallises as a hydrate and exists in a *trans* conformation with respect to the N2=C10 bond [1.2815 (14) Å]. The benzofuran ring system (O1/C1-C8, r.m.s deviation = 0.016 Å) forms a dihedral angle of 2.96 (5)° with the benzene ring (C11-C16). Bond lengths and angles are comparable to those in related structures (Fun *et al.*, 2012*a*, 2012*b*)

In the crystal (Fig.2), molecules are linked *via* O1W–H2W1⋯O2, O1W–H1W1⋯O2 and C6–H6A⋯O2 trifurcated acceptor bonds (Table 1) and together with N1–H1N1⋯O1W hydrogen bonds form two-dimensional arrays parallel to (100).

S2. Experimental

The title compound was obtained by refluxing a mixture of 1-benzofuran-2-carbohydrazide (0.01 mol), 4-bromobenzaldehyde (0.01 mol) in ethanol (30 ml) and 3 drops of concentrated sulfuric acid for 1 h. Excess ethanol was removed from the reaction mixture under reduced pressure. The solid product obtained was filtered, washed with ethanol and dried. Colourless blocks were obtained by slow evaporation of an ethanol-*N,N*-dimethylformamide (DMF) (3:1) solution.

S3. Refinement

Atom H1N1 was located in a difference Fourier map and refined freely [N1–H1N1 = 0.890 (17) Å]. O-bound H atoms were located in a difference Fourier map and refined using a riding model with O–H = 0.8182 or 0.8477 Å. The rest of hydrogen atoms were positioned geometrically and refined using a riding model with C–H = 0.93 Å and $U_{iso}(H) = 1.2 U_{eq}(C)$.

Figure 1

The molecular structure of the title compound showing 50% probability displacement ellipsoids for non-H atoms.

Figure 2

The crystal structure of the title compound, viewed along the b axis. H atoms not involved in hydrogen bonds (dashed lines) have been omitted for clarity.

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F , and R-factors based on ALL data will be even larger.
