Received 14 June 2012; accepted 22 June 2012

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.027; wR factor = 0.069; data-to-parameter ratio = 8.4.

In the title compound, $\text{C}_{13}\text{H}_{12}\text{O}_3$, the pyran ring adopts a half-chair conformation with a C atom deviating from the least-squares plane of the remaining ring atoms by 0.606 (2) Å. This plane and that of the benzene ring make a dihedral angle of 44.18 (6)°. In the crystal, molecules are linked through $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds into infinite chains along the b axis, and these chains are cross-linked by $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds into sheets lying parallel to the bc plane. The layers are further connected *via* $\text{C}-\text{H}\cdots\pi$ interactions to form a three-dimensional supramolecular structure.

5-Hydroxy-6-[(*E*)-2-phenylethenyl]-5,6-dihydro-2*H*-pyran-2-one isolated from *Goniothalamus ridleyi*

Samsiah Jusoh, Laily B. Din, Zuriati Zakaria and Hamid Khaledi

S1. Comment

The title compound was isolated from the roots of *Goniothalamus ridleyi* and found to be the same styrylpyrone isolated from the stem bark of *Goniothalamus dolichocarpus* (Goh *et al.*, 1995). In agreement with the structures of similar molecules (Fun *et al.*, 1995; Tuchinda *et al.*, 2006), the pyran ring in the title molecule adopts a half-chair conformation with C9 displaced by 0.606 (2) Å from the plane of the remaining ring atoms (C10/C11/C12/C13/O3). This plane and the benzene ring make a dihedral angle of 44.18 (6)°. The crystal packing comprises three dimensional network formed by O—H⋯O, C—H⋯O and C—H⋯π interactions (Table 1, Fig. 2).

S2. Experimental

Samples of the roots of *G. ridleyi* were collected from Post Brooke, Gua Musang, Kelantan, Malaysia. The roots were dried in an oven (323 K), ground and extracted using cool extraction. The extraction using three types of solvents *i. e.*, hexane, chloroform and methanol gave three crude extracts. The chloroform crude extract (9.57 g) was separated using vacuum liquid chromatography (VLC). A mixture solvent of ethyl acetate and methanol as eluent solvent gave 12 fractions. TLC profiles showed fractions 1–3 were identical. Therefore, these fractions has been selected for further separation using column chromatography (CC) with eluent solvents hexane and ethyl acetate; 178 vials were collected and vials 157–165 have been selected for preparative TLC (PTLC) using hexane:ethyl acetate (9:11). GRAB 6 (0.0617 g) with R_f 0.46 in solvent system hexane: ethyl acetate (5:5) was crystallized from a mixture of ethyl acetate and n-hexane (1:1) at room temperature.

S3. Refinement

The C-bound hydrogen atoms were located in the calculated positions and refined in a riding mode with C—H distances of 0.95 (C_{sp2}) and 1.000 (C_{sp3}) Å. The O-bound H atom was found in a difference Fourier map and refined freely. For all hydrogen atoms, U_{iso} were set to $1.2U_{eq}$ (carrier atom). In the absence of significant anomalous scattering effects Friedel pairs were merged.

Figure 1

Molecular structure of the title compound with displacement ellipsoids drawn at 50% probability level. Hydrogen atoms are drawn as spheres of arbitrary radius.

Figure 2

A view of the O—H...O, C—H...O and C—H... π interactions in the structure. Hydrogen atoms, except those involved in hydrogen bonding, are omitted. Symmetry codes: ' = $-x + 1, y - 1/2$; '' = $x - 1, y, z$; ''' = $-x + 2, y - 1/2, -z + 1$.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
