5-Bromo-2-hydroxybenzonitrile

Scott Oh and Joseph M. Tanski*

Department of Chemistry, Vassar College, Poughkeepsie, NY 12604, USA

Correspondence e-mail: jotanski@vassar.edu

Received 5 July 2012; accepted 11 July 2012

 Key indicators: single-crystal X-ray study; $T = 125$ K; mean $\sigma(\text{C}-\text{C}) = 0.005$ Å; R factor = 0.043; wR factor = 0.100; data-to-parameter ratio = 22.5.

The title compound, $\text{C}_7\text{H}_4\text{BrNO}$, crystallizes with two molecules in the asymmetric unit. The two molecules exhibit nearly linear $\text{C}-\text{C}\equiv\text{N}$ nitrile bond angles of 179.1 (4) and 177.1 (4)°. In the crystal, the molecules are linked into a one-dimensional hydrogen-bonded chain by interactions between the phenol H atom and the nitrile N atom [$\text{N}\cdots\text{O} = 2.805$ (4) and 2.810 (4) Å].

5-Bromo-2-hydroxybenzotrile

Scott Oh and Joseph M. Tanski

S1. Comment

The title compound, 5-bromo-2-hydroxybenzotrile, may be prepared by a variety of methods, including bromination of *o*-cyanophenol (Oberhauser, 1997), addition of nitrile to *p*-bromophenol (Anwar & Hansen, 2008), cobalt(II) catalyzed conversion of 5-bromo-2-hydroxyaldehyde to the nitrile (Tamilselvan *et al.*, 2009), and photochemically from 5-chloro-2-hydroxybenzotrile in the presence of bromide ions (Bonnichon *et al.*, 1999). The 5-bromo-2-hydroxybenzotrile is used as a synthetic reagent in the synthesis of biologically active compounds such as potential antiretroviral drugs (Jiang *et al.*, 2011), cancer therapies (Tshako *et al.*, 2012), and osteoporosis treatments (Wetzel *et al.*, 2011).

The asymmetric unit contains two unique molecules of the title compound (Fig. 1) which are hydrogen bonded into an infinite one-dimensional chain (Fig. 2). The phenoxy group acts as the hydrogen donor and the nitrile group as the acceptor, with O \cdots N distances of 2.805 (4) Å and 2.810 (4) Å, and O–H \cdots N angles of 170 (5)° and 175 (5)°. The metrical parameters are similar to those found in the structure of *o*-cyanonitrile, which also crystallizes with two molecules in the asymmetric unit, and exhibits O \cdots N distances of 2.795 (2) Å and 2.798 (2) Å, and O–H \cdots N angles of 173 (2)° and 172 (2)° (Beswick *et al.*, 1996). As in the structure of *o*-cyanonitrile, the molecules of the title compound are nearly planar, with a root mean square deviations from the plane of all atoms, excluding the aryl H atoms, of 0.0334 Å and 0.2747 Å. In each molecule in the asymmetric unit, the greatest deviation from the plane is the phenolic hydrogen atom, presumably to maximize the hydrogen bonding interaction between neighboring molecules, which make a dihedral angle between them of 12.6 (5)°.

S2. Experimental

Crystalline 5-bromo-2-hydroxybenzotrile was purchased from Aldrich Chemical Company, USA, and was recrystallized from chloroform.

S3. Refinement

Hydrogen atoms based on carbon were included in calculated positions and refined using a riding model at C–H = 0.95 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}_{\text{aryl}})$. Hydrogen atoms based on oxygen were refined semifreely with the help of a distance restraint O–H = 0.84 Å, and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$.

Figure 1

A view of the two independent molecules of the title compound with the atom numbering scheme. Displacement ellipsoids are shown at the 50% probability level. H atoms are presented as a small spheres of arbitrary radius. One of the hydrogen bonds is drawn with a dashed line.

Figure 2

A view of the one-dimensional hydrogen bonding chain. H atoms not involved in H-bonds are omitted for clarity.

 $T_{\min} = 0.389$, $T_{\max} = 0.845$
 11040 measured reflections
 4213 independent reflections
 3254 reflections with $I > 2\sigma(I)$

$R_{\text{int}} = 0.032$
 $\theta_{\text{max}} = 30.5^\circ$, $\theta_{\text{min}} = 1.9^\circ$
 $h = -5 \rightarrow 5$

$k = -12 \rightarrow 12$
 $l = -30 \rightarrow 30$

Refinement

Refinement on F^2
 Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.043$
 $wR(F^2) = 0.100$
 $S = 1.03$
 4213 reflections
 187 parameters
 2 restraints
 Primary atom site location: structure-invariant
 direct methods

Secondary atom site location: difference Fourier
 map
 Hydrogen site location: inferred from
 neighbouring sites
 H atoms treated by a mixture of independent
 and constrained refinement
 $w = 1/[\sigma^2(F_o^2) + (0.050P)^2 + 0.6935P]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\text{max}} = 0.001$
 $\Delta\rho_{\text{max}} = 1.67 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\text{min}} = -0.57 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
