Correspondence e-mail: seikweng@um.edu.my

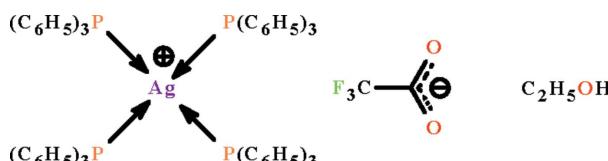

Received 27 October 2012; accepted 31 October 2012

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; disorder in main residue; R factor = 0.047; wR factor = 0.122; data-to-parameter ratio = 16.6.

In the title solvated salt, $[\text{Ag}(\text{C}_{18}\text{H}_{15}\text{P})_4](\text{CF}_3\text{CO}_2)\cdot\text{C}_2\text{H}_5\text{OH}$, the Ag^{I} atom is coordinated by four P atoms from triphenylphosphane ligands in a distorted tetrahedral geometry. The anion and solvent are engaged in weak $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds. Of the four triphenylphosphane ligands, two each have an equally disordered phenyl ring while the Ag^{I} atom is disordered over two positions in a 0.9595 (15):0.0405 (15) ratio and the trifluoroacetate anion is equally disordered over two positions with respect to the lattice ethanol molecule.

Tetrakis(triphenylphosphane- κP)silver(I) trifluoroacetate ethanol monosolvate

Seik Weng Ng

S1. Comment

Silver trifluoroacetate acetate forms a mononuclear bis-adduct with triphenylphosphane when the reaction was carried out in ethanol solvent (Ng, 1998). A similar synthesis but with a 1:4 stoichiometry has yielded a salt (Scheme I, Fig. 1) in which four phosphane ligands bind to the metal atom; the trifluoacetate anion does not engage in coordination, and is instead disordered with respect to an ethanol molecule. The disorder is such that the anion occupies two positions, as does the two solvent molecules (Fig. 2). The anion and solvent are engaged in weak hydrogen bonding (Table 1).

S2. Experimental

Silver trifluoroacetate (1 mmol) and triphenylphosphane (4 mmol) were heated in ethanol (25 ml) until the reactants dissolved completely. Colorless crystals were isolated from the filtered solution after several days.

S3. Refinement

Carbon-bound H-atoms were placed in calculated positions (C—H 0.95 to 0.98 Å) and were included in the refinement in the riding model approximation, with $U(H)$ set to 1.2 to 1.5 $U(C)$.

The silver atom is disordered over two positions in a 0.960 (2): 0.040 ratio. The minor component atom could not be refined anisotropically, and its temperature factor was instead tied to the equivalent isotropic temperature factor of the major component by a factor of one. Neglecting the minor component resulted in largest peaks in vicinity of Ag1.

The trifluoroacetate ion is disordered over two positions; as the occupancy refined to nearly 50%, the disorder was then fixed as a 1:1 type of disorder. The C—O distances were restrained to 1.25 ± 0.01 Å, the C—C distances to 1.50 ± 0.01 Å and the C—F distances to 1.35 ± 0.01 Å. Additionally, the O···O distances were restrained to 2.17 ± 0.01 Å and the F···F distances to 2.21 ± 0.01 Å.

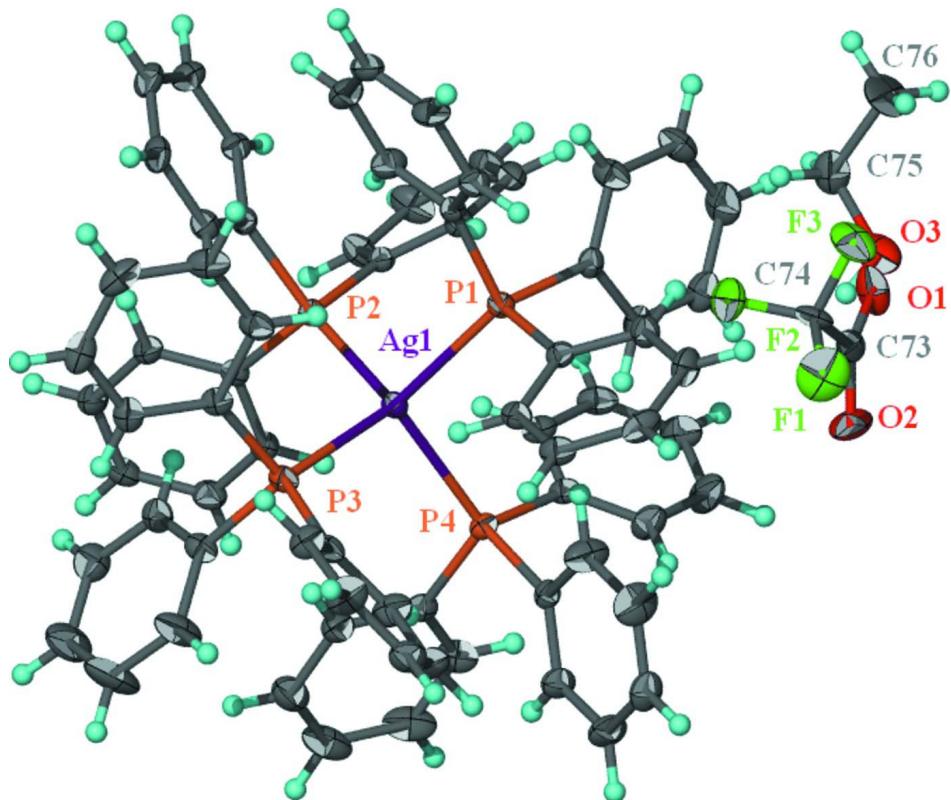

Both half-occupancy trifluoroacetate portions are each hydrogen bonded to a half-occupancy ethanol molecule. For the ethanol molecules, the C—O distance were restrained to 1.45 ± 0.01 Å and the C—C distances to 1.50 ± 0.01 Å. The H atoms were placed in riding positions (O—H 0.84 Å) and their temperature factors tied by a factor of 1.5 times.

The anisotropic temperature factors of the disordered atoms were restrained to be nearly isotropic.

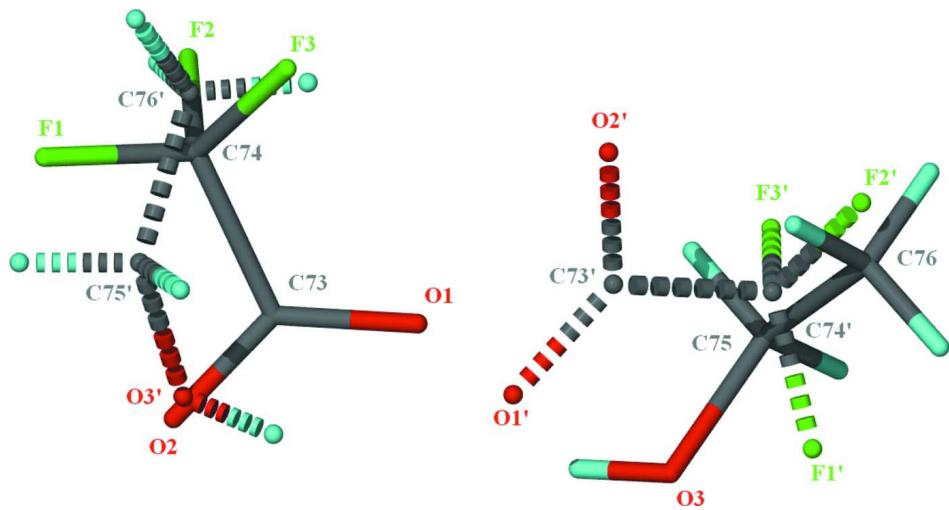

Of the four triphenylphosphine groups, two have each a disordered phenyl ring. The disorder was also treated as a 1:1 type of disorder. Pairs of As—C distances were restrained to within 0.01 Å of each other. The aromatic rings were refined as a rigid hexagon of 1.39 Å sides, and the temperature factors of the primed atoms were set to those of the unprimed ones. The anisotropic temperature factors were also restrained to be nearly isotropic.

The (0 - 1 1) reflection that was affected by the beamstop as well as (-5 4 6) were omitted.

The final difference Fourier map was featureless except for a peak at 0.86 Å from Ag1 and a hole at 0.68 Å from the same atom.

**Figure 1**

Thermal ellipsoid plot (Barbour, 2001) of $[\text{Ag}(\text{C}_{18}\text{H}_{15}\text{P})_4](\text{CF}_3\text{CO}_2)\text{C}_2\text{H}_5\text{OH}$ at the 70% probability level; hydrogen atoms are drawn as spheres of arbitrary radius. The disorder is not shown, and only selected atoms are labeled owing to crowding.

**Figure 2**

Disorder in the anion/solvent.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
