Key indicators: single-crystal X-ray study; T = 298 K; mean σ (C–C) = 0.005 Å; Hatom completeness 53%; R factor = 0.048; wR factor = 0.153; data-to-parameter ratio = 14.8.

The title polymeric coordination compound, $\{[Co_2(C_{10}H_2O_8) (H_2O)_8$]·8H₂O₁, was obtained by slow diffusion of a dilute aqueous solution of CoCl₂ and the sodium salt of benzene-1,2,4,5-tetracarboxylic acid (H₄btec) through an agar–agar gel bridge in a U-shaped tube. The two independent Co²⁺ ions are each situated on an inversion centre and are coordinated in a slightly distorted octahedral geometry by four water O atoms and two carboxylate O atoms from two btec⁴⁻ ligands $(\overline{1} \text{ symmetry})$, forming a layer parallel to $(11\overline{1})$. This layer can be described as a molecular two-dimensional square grid with the benzene rings at the nodes and the Co^{II} atoms connecting the nodes. O-H···O hydrogen-bonding interactions involving the coordinating water molecules, the carboxylate O atoms and lattice water molecules lead to the formation of a three-dimensional network.

Poly[[octaaqua- μ_4 -(benzene-1,2,4,5-tetracarboxylato)-dicobalt(II)] octahydrate]

Magatte Camara, Modou Tine, Carole Daiguebonne, Olivier Guillou and Thierry Roisnel

S1. Comment

The design of metal-organic materials with large channels and cavities has been deeply investigated, due to their intriguing structural diversity and potential functions as microporous solids for molecular adsorption, ion exchange, and heterogeneous catalysis. For related structures in this context, see: Yaghi *et al.*, 1998; Evans *et al.*, 1999; Eddaoudi *et al.*, 2002; Guillou *et al.*, 2006. The benzene-1,2,4,5-tetracarboxylate ligand (btec⁴⁻) as a multi-connecting ligand is an excellent candidate for the design of coordination polymers. Surprisingly, examples of coordination polymers involving this ligand are relatively scarce. For examples of coordination polymers with this ligand, see: Cheng *et al.*, 2000; Chu *et al.*, 2001; Rochon & Massarweh, 2000; Wu *et al.*, 2002; Luo *et al.*, 2013). We report here the synthesis and the crystal structure of the title coordination polymer.

All carboxylic groups of the organic ligand in the title compound are deprotonated and each of them adopts a monodentate coordination mode. There are two crystallographically independent Co^{II} atoms in the structure. In both cases the Co^{II} atoms are coordinated by two carboxylate oxygen atoms from two btec ligands and four water oxygen atoms (Fig. 1). There is no significant difference in the coordination distance between carboxyl and water oxygen atoms. The coordination Co^{II} of distances in the title polymeric compound range from 2.067 (3) to 2.129 (3) Å. Each btec⁴⁻ ligand links four Co^{II} atoms and each Co^{II} atom is bond to two btec⁴⁻ ligands to form a two-dimensional layer. These layers can be described as a molecular two-dimensional square grid in which the phenyl rings are at the nodes and the Co^{II} atoms connecting the nodes (Fig. 2). The area of the square cells of the grids is larger than 120 Å² (11.3 Å *x* 11.5 Å). The crystal packing is enforced by a complex hydrogen bonds network that involves the crystallization water molecules located in the inter-layer space.

S2. Experimental

All reagents were used as obtained without further purification. Cobalt chloride was purchased from STREM Chemicals. benzene-1,2,4,5-tetracarboxylic acid was purchased from Acros Organics. Its sodium salt was prepared by addition of four equivalents of sodium hydroxide to a suspension of benzene-1,2,4,5-tetracaboxylic acid in de-ionized water until complete dissolution. Then, the solution was evaporated to dryness. The solid phase was then put in suspension in ethanol, stirred and refluxed during 1 h. After filtration and drying in a desiccator, a white powder of tetra-sodium benzene-1,2,4,5-tetracarboxylate was obtained. The yield of this synthesis is 90%.

Single crystals of the coordination polymer were obtained by slow diffusion of dilute aqueous solutions of Co(II) chloride (0.25 mmol in 20 ml) and of sodium salt of benzene-1,2,4,5-tetracarboxylic acid (0.25 mmol in 20 mL) through an agar-agar gel bridge in a U-shaped tube. The gel was purchased from Acros Organics and jellified according to established procedure. For a related procedure, see: Henisch & Rustum, 1970; Henisch, 1988; Daiguebonne *et al.*, 2003. After several weeks, very light pink single crystals were obtained.

S3. Refinement

H-atoms from crystallization water molecules could not be assigned reliably and were thus not included in the refinement, but they were taken into account for the chemical formula sum, moiety, weight, as well as for the absorption coefficient and the number of electrons in the unit cell.

Figure 1

Extended asymetric unit of the title compound, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level. [Symmetry codes: (i) -x, -y, -z + 1; (ii) -x, -y - 1, -z; (iii) -x + 1, -y - 1, -z + 1.]

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
