Received 27 November 2013; accepted 7 December 2013

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.075; wR factor = 0.178; data-to-parameter ratio = 13.5.

In the title molecule, $C_{27}\text{H}_{30}\text{O}_{10}$, the benzene rings form a dihedral angle of $14.9(2)^\circ$. The $\text{C}=\text{C}$ bond is in an *E* conformation. In the crystal, weak $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds connect the molecules, forming a three-dimensional network.

The chalcone ethyl 2-[4-(2-{2,4-bis[(ethoxycarbonyl)methoxy]benzoyl}-ethenyl)phenoxy]acetate

Xiaofeng Liu

S1. Comment

It has been determined in the authors lab that the title compound is a potential inhibitor of mushroom tyrosinase (results to be published soon) and the crystal structure determination of the title compound has been carried out to investigate its structure property relationships.

In the title molecule (I, Fig. 1) the two benzene rings (C10-C15/C1-C6) form a dihedral angle of 14.9 (2) $^{\circ}$. The C=C bond is in an E conformation. In the crystal, weak C—H···O hydrogen bonds connect molecules forming a three-dimensional network (Fig. 2). The structure of a related compound, (E)-1-(2,4-Dihydroxyphenyl)-3-(4-hydroxyphenyl)-prop-2-en-1-one monohydrate, has been published previously (Wang *et al.*, 2011).

S2. Experimental

Isoliquiritigenin (2.56 g, 0.01 mol) and potassium hydroxide (2.45 g, 0.0438 mol) were dissolved in dry acetone (100 ml) in a three-neck flask. Then ethyl bromoacetate (6.93 g, 0.0415 mol) was dropwise added at room temperature and vigorously stirred for 3 h. The progress of the reaction was monitored by TLC (Si gel, developing solvent *V* (ethyl acetate) / *V* (benzene) = 1:2). After suction filtration and distilled to remove the solvent, a light yellow solid was obtained, 4.39 g, yield 85.4%. Recrystallization from ethanol produced light yellow needles.

S3. Refinement

All hydrogen atoms were placed in ideal positions with the C—H = 0.93 Å, C—H = 0.96 Å and C—H=0.97 Å with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ or $1.5U_{\text{eq}}(\text{Cmethyl})$.

Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H-atom parameters constrained
 $w = 1/[\sigma^2(F_o^2) + (0.0569P)^2 + 1.0739P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\text{max}} = 0.001$
 $\Delta\rho_{\text{max}} = 0.39 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\text{min}} = -0.23 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
