Received 18 December 2013; accepted 25 January 2014

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.015\text{ \AA}$; disorder in main residue; R factor = 0.032; wR factor = 0.075; data-to-parameter ratio = 11.6.

The title complex, $[\text{Ir}(\text{C}_5\text{H}_8\text{NO}_2)\text{H}(\text{C}_3\text{H}_9\text{P})_3]\text{PF}_6$, has two independent anion-cation pairs in the asymmetric unit. The geometry about each Ir^{III} atom is pseudo-octahedral with a meridional arrangement of the $\text{P}(\text{CH}_3)_3$ ligands, N,O -bidentate coordination of proline and a hydride ligand *trans* to the proline N atom. The independent Ir^{III} moieties are joined by $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds and the $\text{N}-\text{H}\cdots\text{O}$ bonding motif continues throughout the structure, creating an extended chain parallel to the *c*-axis direction. The methyl groups of one $\text{P}(\text{CH}_3)_3$ ligand are rotationally disordered over two sets of sites in a 0.62 (2):0.38 (2) ratio.

Hydrido(prolinato- κ^2N,O)tris(trimethylphosphane- κP)iridium(III) hexafluoridophosphate

Joseph S. Merola and Christopher P. Roy

S1. Experimental

[Ir(COD)(PMe₃)₃]Cl was synthesized as reported previously (Frazier & Merola, 1992). L-proline was purchased from Aldrich Chemical and used as received. Water was deionized/distilled.

S1.1. Synthesis and crystallization

A 100 mL flask equipped with a stir bar and septum was charged with 117.5 mg (1.02 mmol) of L-proline. The flask was then charged with 250 mg (0.443 mmol) of [Ir(COD)(PMe₃)₃]Cl under N₂ in a drybox. The flask was then connected to a double manifold (vacuum/nitrogen) Schlenk line and 20 mL of distilled water was added to the flask *via* syringe. The solution was stirred magnetically and heated to reflux. After 18 hours at reflux the reaction mixture was allowed to cool and solvent was removed *in vacuo*. The white solid residue was treated with distilled methylene chloride (3 x 10 mL) to extract the product from the excess amino acid. The solution was filtered from the solid using cannula techniques. The methylene chloride was removed *in vacuo* and the solids were dried under reduced pressure to yield 150 mg (0.263 mmol, 60.7% yield based on the amount of Ir(COD)(PMe₃)₃]Cl of [Ir(L-pro)(H)(PMe₃)₃]Cl C,H analysis: Calculated for C₁₄H₃₆NO₂P₃IrCl:C, 29.4% H, 6.3% Found: C, 29.17%; H, 6.2% An aqueous solution of the chloride salt was treated with an aqueous solution of K[PF₆] to precipitate [Ir(L-pro)(H)(PMe₃)₃][PF₆]. Crystals suitable for X-ray diffraction were grown from dichloromethane/diethylether.

S1.2. Refinement

Hydrogen atoms were treated with a combination of restrained refinement (*i.e.* for the Ir—H hydrogens) and constrained riding models. Values of U_{iso}(H) were set to either 1.2U_{eq} or 1.5U_{eq} of the parent atom. Crystal data, data collection and structure refinement details are summarized in Table 1.

S2. Results and discussion

The chemistry of amino acid complexes of transition metals has a long history (Shimazaki *et al.*, 2009). A search of the CSD data base (Allen, 2002) reveals over 1400 hits for compounds with bidentate N,O coordination of amino acids to transition metals. Restricting the search to the specific amino acid proline, yields over 140 hits. Finally, restricting the search to iridium compounds, there are 6 CSD structures with proline coordinated to iridium. We reported on the crystal structure of [hydrido-valinato-tris(trimethylphosphine)iridium][hexafluorophosphate] (CSD:20060907) (Roy *et al.*, 2006) in the space group P4₃, which has very strong intermolecular N—H···O hydrogen bonding that results in a 4₃ helical arrangement of the iridium complexes. In this report, the title proline complex has a "flatter" intermolecular motif with the N—H···O hydrogen bonding resulting in a one-dimenional chain motif with the chain parallel to the c-axis. Hydrogen bonding parameters are listed Table 1. A similar motif has been reported for (η^5 -Pentamethyl-cyclopentadienyl)-(t-butyl-

ethynyl)-(L-prolinato- N,O)-iridium (CSD:20010919) (Carmona *et al.*, 2000), but when the t-butylethynyl group is replaced by chloride (CSD: 19911024) (Carmona *et al.*, 2012), the motif changes to alternating N—H···O and N—H···Cl bonding to generate the full lattice.

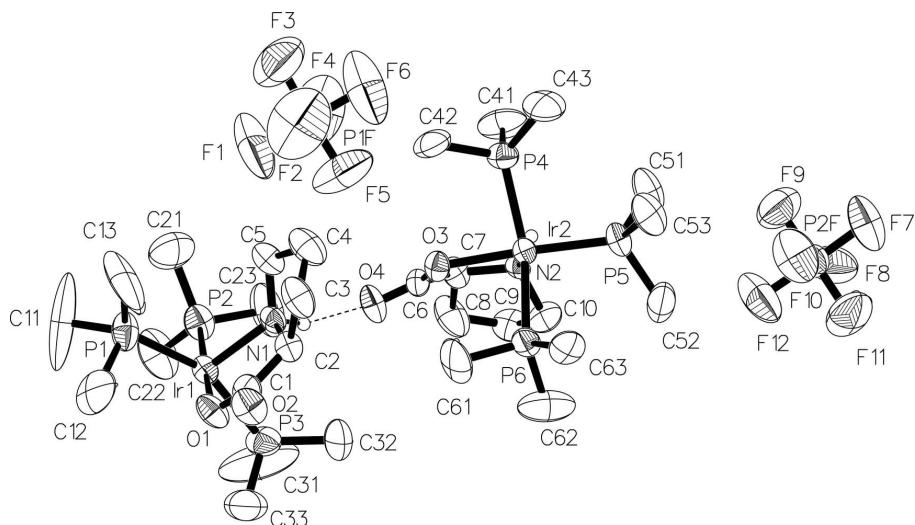

Figure 1

The asymmetric unit of the title compound, showing both sets of independent cations and anions. Hydrogen atoms are omitted for clarity. The displacement ellipsoids are shown at the 50% probability level and only the major component of the disordered methyl groups on P1 is shown.

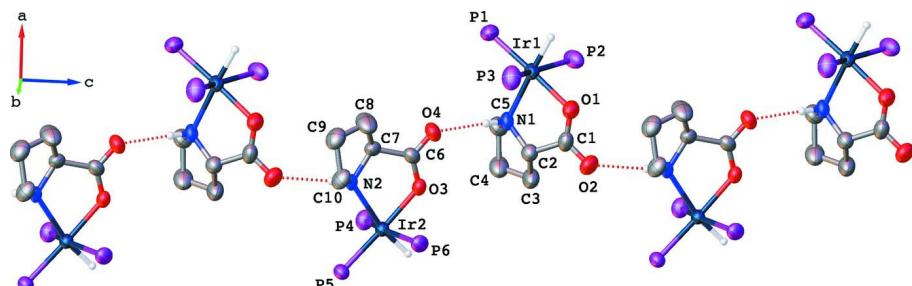

Figure 2

Hydrogen bonding motif for the title compound. Hydrogen atoms (with the exception of the metal hydrides and N—H atoms) and phosphorus methyl groups are omitted for clarity.) The displacement ellipsoids are shown at the 50% probability level.

Data collection

Siemens P4
diffractometer
Radiation source: fine-focus sealed tube
Graphite monochromator
 ω -scans
Absorption correction: ψ scan
(North *et al.*, 1968)
 $T_{\min} = 0.618$, $T_{\max} = 1.000$
6363 measured reflections

6055 independent reflections
5587 reflections with $I > 2\sigma(I)$
 $R_{\text{int}} = 0.020$
 $\theta_{\max} = 27.5^\circ$, $\theta_{\min} = 1.9^\circ$
 $h = 0 \rightarrow 14$
 $k = 0 \rightarrow 26$
 $l = -15 \rightarrow 15$
3 standard reflections every 300 reflections
intensity decay: 0(1)

Refinement

Refinement on F^2
Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.032$
 $wR(F^2) = 0.075$
 $S = 1.06$
6055 reflections
522 parameters
4 restraints
Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
 $w = 1/[\sigma^2(F_o^2) + (0.0445P)^2 + 1.0877P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} = 0.001$
 $\Delta\rho_{\max} = 1.02 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.93 \text{ e } \text{\AA}^{-3}$
Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Extinction coefficient: 0.00105 (12)
Absolute structure: Flack (1983)
Absolute structure parameter: 0.001 (8)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
